

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### **Usage guidelines**

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

Chemical Trade Journal  
Supplement, July 25, 1896

THE  
CHEMICAL TRADE  
JOURNAL:

A WEEKLY NEWSPAPER DEVOTED TO

*The Commercial Aspect of the Chemical and Allied Industries.*

EDITED BY

*GEORGE E. DAVIS,*

FORMERLY ONE OF HER MAJESTY'S INSPECTORS OF ALKALI WORKS.  
CHEMICAL ENGINEER AND CONSULTING CHEMIST.

VOLUME XVIII.

[JANUARY TO JUNE, 1896.]

MANCHESTER:

DAVIS BROS., 32, BLACKFRIARS STREET.

---

1896.

**251104A**

MANCHESTER:

PRINTED BY DAVIS BROS., 32, BLACKFRIARS STREET.

# THE CHEMICAL TRADE JOURNAL AND OIL, PAINT and COLOUR REVIEW.

Publishing Offices: 32, BLACKFRIARS STREET, MANCHESTER.

No. 450.

SATURDAY, JANUARY 4, 1895.

Vol. XVIII.

## Contents.

## LATE ADVERTISEMENT.

**WANTED A SITUATION** as Foreman; capable of manufacturing chemical manures, suitable for Home and the Continent, and managing acid chambers and concentrating O. V. Plant. Twelve years' experience; good references; moderate salary—Address, B.N., *Chemical Trade Journal Office*, Manchester.

## ANNUAL SPECIAL ISSUE, 1896.

The usual Double New Year Number of the *CHEMICAL TRADE JOURNAL*, to be issued on January 18th, 1896, will contain a number of illustrated technical articles, in addition to the other special features of this issue. Advertisers are requested to consult our advertising columns for further particulars.

SUBSCRIBERS and others will oblige by ordering extra copies as early as possible,

ESPECIALLY for the CONTINENT and ABROAD.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

10 Words and under..... 2s. 6d. per insertion.  
Each additional 10 words..... 6s. 6d. "

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

30 Words and under..... 1s. 6d. per insertion.  
Each additional 10 words..... 3s. 3d. "

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff rates which will be forwarded on application.

Advertisements intended for insertion in the current week's issue should reach the office by Thursday morning at the latest.

## THE PAST, PRESENT, AND FUTURE.

CONCERNING the first section of our heading the year which has just closed does not lend itself to favourable comment, and it is somewhat difficult to act up to the time-honoured custom of saying nothing but good of the defunct. If we had to write its epitaph we should be disposed to say that, "Born without promise, it deserted its friends in youth, betrayed its colleagues in manhood, and would have died unmourned had it not been for the tardy reparation of its old age." It is, however, something to be able to chronicle a change for the better at the close of a year, otherwise so hope-shorn and depleted. As regards

### THE ALKALI TRADE,

the year 1895 has not been an uneventful one. We are glad to be able to say that the largest makers have come round to the line of policy which we urged upon them in our first issue of the past year, and having buried the hatchet, and re-charged the calumet of peace, are prepared to divide in amity a trade which, under the happiest circumstances, is none too large for the requirements of the dividend-loving shareholder. The moderation of the combine in fixing the price of ammonia soda ash at £3. 7s. 6d. in bags at works is to be highly commended. We do not say the market could not bear a higher figure, but wisdom counsels very cautious advances in this direction. It is a matter for regret that both bleach and caustic have failed to hold their own, and in both cases the outlook is rendered dubious by electrolysis. The glowing accounts which the chairman of the Electro Chemical Company recently gave to his shareholders of the company's successful working may perhaps be taken *cum grano salis*, but the problem of electrolytic production can scarcely be wisely treated as one that cannot be solved. The Castner-Kellner Company and Mr. Hargreaves, of Widnes have also to be reckoned with before a forecast of the future can be worth anything, and, instead of prophesying, we prefer to wait events. It is said that the nitric acid bleach plant, in course of erection at Middlesbrough, will not be ready quite so soon as was anticipated, and it is further rumoured that the difficulties of delay are not the only ones with which those interested have to contend. A very notable feature has been the recent rise in the price of salt cake, which comes as an antidote to the decline in bleach. The commonsense of the trade awoke to the fact that there was absolutely no reason why salt cake should be given away for 12s. per ton, and a cool survey of the position soon led to a happier state of things. We must not omit to record the acquisition by Messrs. Brunner, Mond and Co. of new alkali works on the Tees, and at Middlesbrough for the inauguration of their new plant for making caustic soda from soda ash by calcination with oxide of iron.

## TAR AND AMMONIA PRODUCTS.

In reviewing this industry it has previously been necessary to deplore the condition of the tar products, and to seek consolation in the position of sulphate of ammonia. It will be seen, however, on looking at the progress during the past year, that the positions have been reversed. Benzols, though they opened rather badly, improved as the year progressed, and are now decidedly strong, fetching good prices for both 90's and 50/90's. It would be a difficult matter to state exactly how far these improvements are due to the efforts of the Tar Products Syndicate. Undoubtedly, their work during the past two years has not been wasted, though, of course, much has depended on the better outlook which has been created by the more extended use of benzol for gas enrichment and kindred purposes. The attempt at a combine in Germany, if not finally carried out upon the exact lines which characterised its inception, has undoubtedly been productive of good rather than the reverse. Carbolic Acids have been fairly steady, particularly 60% crude. There was little fluctuation in the price during the earlier months of the year, and this steadiness, with the close of 1895, gave place to an advance, particularly for crude, while crystals have followed suit in a proportionate degree. Naphthas, on the whole, have been slow, and there would have been little to say had it not been for the sudden advance which took place in December. The relative values of naphtha and benzol have been somewhat anomalous, and their peculiar position seems to have at last demanded attention, if we may judge by the correspondence which has appeared in those journals which deal prominently with the weekly prices of these products. Whether the outcome of the correspondence will prove to be anything of practical utility is far too problematical a point to be definitely answered at the present moment. Sulphate of Ammonia is an article concerning which, in its present position, "the least said is soonest mended," and we cannot but wish that by saying a "little" we could mend the market. Some ultra pessimists are prone in the belief that at present the "market" is an unknown quantity, but we think that the statistics of shipments afford the best answer to this somewhat exaggerated view, particularly the figures for the exports to the U.S.A. Unfortunately, the volume of the business is not so important as the monetary values at which the transactions are affected, and on this point it would indeed be hard not to give vent to pessimistical expressions. Prices at the beginning of the year were none too high, and though an improvement set in, £11. 8s. 9d. being realised, this price resolved itself into a turning point, for since the realisation of this figure there has been a gradual decline. Prices now approximate closely to what threatens to be the vanishing point of profits, since the spot value is to-day from £8. 10s. to £8. 12s. 6d. per ton.

## THE MANURE TRADE

has not been marked by anything of a startling character during the past twelve months. If the paradox is pardonable, it has been in a state of passive activity, cheapness having been the leading *motif*. The prolonged and severe depression in agriculture has truly exercised an adverse influence upon the manure trade; but, on the other hand, it would appear that, just as the restrictions imposed upon the alkali and paper trades led to economies which ultimately developed into sources of revenue, so the depression in agriculture seems to be leading to greater efficiency in farming, and to the more judicious and extensive use of fertilisers. Superphosphates appear to be growing in favour. The price as kept steady, while the continued abundance of cheap

vitriol must be very welcome to manufacturers. To judge by much of the technical literature that has appeared during the last twelve months, the importance of supers. is being recognised, and the advantages of this particular fertiliser brought prominently before farmers. Phosphates are as largely used as ever, it being estimated that the total consumption in this country amounts to four million tons per annum. With regard to the details of prices and their fluctuations, we shall say nothing here, as this matter is fully dealt with in the annual report of the year's trade which will appear in an early issue. Concerning sulphate of ammonia, there is little to add to what we have already said in the preceding paragraph. Its cheapness should make it an exceptionally strong competitor to sodium nitrate, which promises to remain somewhere about its present level. Nitrate of soda, like sulphate, has been well-nigh ruinously cheap, but whether the Combine is effected or not, the possibility of its completion has had the effect of strengthening the market and raising prices a little above the dead level at which they have remained so long. Though the advantages of ploughing-in leguminous crops, specially grown for this purpose, is a factor in the future of nitrogenous fertilisers, we are disposed to think that for the immediate future there is little cause to entertain fears of nitrate, or any other quickly-acting nitrogenous manure, suffering from this new competitor. Copper sulphate has been steady, and though closing a little higher in price, should still be as popular as ever in the production of *Bouillie Bordelaise* and insecticides. Certainly Miss Ormrod's list of the insect pests of '95 shows that there is plenty of work for efficient insecticides to accomplish.

## OIL, PAINT, COLOUR, AND VARNISH MANUFACTURERS

have not experienced any very astounding changes during the past year. The unsettled seasons have had an adverse effect upon the decorator's trade, and, in consequence, the paint trade has suffered at the same time. Things, as a whole, have not been abnormally bad, however, while an indifferent state of trade was in a measure to be expected. From September, when there was a change for the better, things have gone on fairly well, as compared with the customary state of business at the time of year. The seed crushing industry has been rather quiet all along. In a limited degree this state of passivity was due to the shortness of seed during the early months of the year. The relief from this shortness came so tardily that almost before the lost ground was made up the slack season set in. In August there was a slight revival, but since then things have gone on somewhat tamely. There is a certain amount of consolation to be found, however, in the fact that if trade has been persistently quiet it has nevertheless been fairly free from labour disputes, which do so much detriment, by dispelling the confidence which is essential to progression in trade. The outlook for the present year is on the whole promising, the very quietude that prevails for the nonce being suggestive of readiness to turn to good account the first opening the New Year affords.

## GLASS, BRICK AND TILE MANUFACTURERS

can hardly be placed in one class, since the last twelve months has not dealt disaster to both industries in the same degree. With glass-makers matters have, indeed, been bad. The cost of raw materials, disputes, and reckless cutting in the prices of the finished products have been the rocks on which complete or partial wreckage has resulted during the financial storms of the past year; while the struggles of one or two companies have been as pitiful as they were

depressing. The outlook unfortunately is not over bright for though the coal trade is quiet as yet, it would be very venturesome to predict the prolonged duration of the present halcyon condition. The struggle has been hard enough with cheap and regular supplies of coal, and it would be a great relief to know that the supplies and prices were going to remain stationary during the present year. In addition, the price of saltcake has been gradually advancing, and is not likely to fall back to the excessively low prices which prevailed in 1894-5. The brick and tile industry has not been anything like as disappointing as the glass trade. It is true, things might have been better, but then they could almost always be that. Considering the unsettled condition of many of the trades upon which the welfare of the brick and tile industry largely depends it would be hardly fair to complain too bitterly about this branch of business. However unsatisfactory the last twelve months may have been, the future prospects are more promising than they are for many others. Though more or less a negative consolation, it is something in these days to seek solace of any kind and not be wholly disappointed. We come now lastly to

#### OUR READERS IN GENERAL,

concerning whom we must be brief. The important questions pending in the textile trades are likely to react one way or another on calico printers, dyers, bleachers, and the drysalers and mineral merchants from whom supplies are obtained. We trust it may be for the better. Soap and candle manufacturers appear to have a little better outlook, though competition is still very keen. Our aim has been to assist with practical information, and accurate trade reports and statistics all those connected with the industries we have referred to. The appreciation we have met with makes us feel that so far we have fulfilled our aim satisfactorily. But we have not been content to rest. The times demand advance, and we have done our best to meet the demand by inaugurating as a regular feature of the *Journal* weekly abstracts of all the complete specifications of chemical and allied technical or electro-chemical patents, expressly prepared for us by specialists in these subjects. The importance of at least keeping *au courant* with modern patents, even if the acquaintance be superficial, has been too long recognised to need further advocacy. Time, however, is an important element, as well as the price for the specifications. While bearing in mind these two factors we would ask our readers to note the provision we have made, whereby they can, at a glance, gather the drift of every chemical patent and select those that may be of use to them. As regards time we are confident that from our abstracts they can acquire a knowledge of the patents of the week in less time than it would be possible to fathom one average full specification, and as to cost one unabstracted patent a week would cost as much as the *Journal* (containing five or six abstracts) for three weeks, to say nothing of the specifications which are sent for, and prove useless or of no interest. Such information is invaluable to you, and we trust you will not let it pass unheeded. In conclusion we have only to perform the pleasing office of wishing each and every one of our readers, in the old country and beyond,

A HAPPY AND PROSPEROUS 1896.

THE ALGERIAN PHOSPHATE DISPUTE.—The Chamber resumed the debate on the interpellation on the Algerian phosphate concession last week. M. Forcioli, one of the deputies for Algeria, maintained there had been no fraud in connection with the granting of any of the concessions. The debate was adjourned.

## LOW TEMPERATURE RESEARCHES.

By H. GRIME.

(Continued from p. 385, Vol. xvii.)

SO much for the liquids which, by their comparatively common occurrence, have perhaps lost some of their popular interest and charm. We will now turn to the consideration of those liquids, whose production during the past few years in large quantities in open vessels has created as much popular and fashionable interest in chemistry as the experimental lectures of Davy, Faraday, or Tyndall.

Oxygen at 181° is a light blue limpid liquid. When first obtained it is sometimes opaque owing to solidified impurities, but these may be readily removed by filtration. Poured into water, it spatters and hisses like red-hot iron, and presently ice-coated globules of liquid oxygen are seen floating about in the water. Alcohol poured upon liquid oxygen speedily solidifies. Liquid nitrogen is colourless, and, as might thence be inferred, liquid air possesses less colour than liquid oxygen. Indeed, as in the case of the gases, the properties of liquid air seem to be those of diluted oxygen. It is an easy matter to obtain liquid air by means of liquid oxygen. When the latter is allowed to boil under reduced pressure in a tube surrounded by air, drops of liquid air soon begin to trickle down the outside of the tube. The nitrogen and the oxygen liquefy together, although there is a difference of 13° in their boiling-points. They do not, however, boil off simultaneously. As the temperature is allowed to rise the more volatile nitrogen boils away first, and the colour of the liquid is seen to deepen until the liquid becomes practically pure oxygen. Although pure oxygen has never been satisfactorily obtained in a solid condition, in the mass, yet the mixture of oxygen and nitrogen, and argon, constituting atmospheric air has been solidified, and interesting speculations have arisen as to the exact condition of the oxygen in solidified air. Does it exist as a true solid or is it, in a still liquid condition, entangled in the solid nitrogen as liquid water is contained by solid gelatin in a jelly? Perhaps some member of the Society may be able to throw light upon the question.

Oxygen in its allotropic modification, ozone, has been obtained as a dark-blue explosive liquid. Of the general properties of bodies at low temperatures, we may say roughly that while chemical activities almost entirely cease certain physical properties remain. Thus liquid oxygen gives a similar absorption spectrum to that given by the gas. After liquefaction it is as poor a conductor of electricity as before, and it has lost none of its thermal transparency. It retains too its magnetic properties.

As chemists we may be excused for considering the chemical properties first. It may be said at once that experimental evidence all goes to show that at or near the absolute zero of temperature the chemical properties of nearly every substance are about as striking as those of argon at ordinary temperatures. We cannot be much surprised at this; for it is common knowledge that, after a certain point, the chemical activity of a body decreases with the *vis viva* of its molecules; solids as a rule re-acting less readily than liquids or gases. Moreover, as we have been shown of late years by Baker and by Hughes, water plays an important part in determining many chemical reactions. At these low temperatures water can of course be present, if at all, only as a solid, and as such can exert little, if any, of its initiating power. On all grounds, therefore, we should anticipate little chemical activity at low temperatures. Pictet has shown that at -150° no chemical action takes place between such substances as nitric acid or sulphuric acid and caustic potash. Olszewski tells us that the brilliancy of freshly cut sodium or potassium is unimpaired by prolonged contact with liquid oxygen. Similarly at -130° oxygen is without action on phosphorus, on solid sulphuretted hydrogen, and on solid hydriodic acid. The electric pile of sodium and carbon ceases to act when placed in liquid oxygen. When rapid combustion has set in, however, it is not at once terminated by plunging the burning substance into liquid oxygen. A piece of ignited wood immersed in the liquid bursts into flame just as in the gaseous oxygen, and a white-hot steel spring continues to burn with deflagration. Burning sulphur lowered into the liquid continues to burn. I may remind you that analogous experiments have long since been described in reference to nitrous oxide. It is possible to have glowing carbon darting backwards and forwards in a state of active combustion at the surface of nitrous oxide, while below is mercury frozen to a solid mass by the intense cold of the liquid. It need hardly be pointed out that in these combustions the portions of matter actually combining are at temperatures far above the temperature of the liquid gas, the heat generated during the combination being sufficient to prevent the temperature of the reacting portions, for some time at any rate, from falling below the temperature at which they cease to unite. Passing from oxygen compounds we meet a statement by Dewar that liquid ethylene and solid bromine may be brought into contact without any change. On the other hand, Olszewski asserts that he has obtained addition compounds by the reaction of chlorine or bromine with ethylene at -102°, a temperature at which ethylene is liquid and bromine and chlorine solid; the reaction

is, however, much less energetic than at ordinary temperatures. It is only fair to add that possibly Dewar's observations were made at a lower temperature than those of Olszewski, for ethylene is liquid at any temperature between  $-102^{\circ}$  and  $-169^{\circ}$ . Even if Dewar's observations respecting ethylene and the halogens are correct, it cannot be stated that the limits of all chemical activity have yet been reached; for at temperatures as low as  $-180^{\circ}$  photographic action does not altogether cease. Some photographs taken by Dewar at  $181^{\circ}$  have been examined by Captain Abney, and he has reported that at this low temperature there is still about 20 per cent. of the ordinary action. Moreover, Dewar finds that the Eastman film cooled to  $-200^{\circ}$  by the evaporation of liquid air in vacuo is still fairly sensitive to photographic action; he appears to suspect, however, that the action differs in some respects from that at ordinary temperatures. This remains to be decided by future work. The main facts, then, in reference to chemical activity at low temperatures point to the conclusion that matter at absolute zero falls under the jurisdiction of the physicist rather than of the chemist. The explosion of ozone at low temperatures is interesting from a chemical point of view, for it is in accordance with its negative heat of formation. It seems to follow that, if a body formed with evolution of heat becomes less stable as the temperature rises, a body formed with absorption of heat must become less stable as the temperature falls. Let me, to conclude this part of the paper, mention a suggestion put forward some time ago by Pictet. He suggested that a parabolic mirror should be constructed of such dimensions that when it was turned towards the sun the temperature at its focus would be higher than that of the hottest furnace. Placed at the focus should be a sun-chamber, constructed of the most refractory substances. In this chamber could be placed one of the known elements. By means of suitable flues the products of the heat action could be instantly drawn off and cooled by circulating currents of, say, liquid air. Pictet conceives it possible that in this way a number of the commonly accepted elements would be resolved into simpler bodies, which at the very low temperatures of the flues would be incapable of reuniting. The thought of high temperatures is naturally associated in our minds with Moissan and the electric furnace. Perhaps when science has her national or international bureaus of Research she may have her Moissans and Pictets uniting their high-temperature and low-temperature forces in some such way as the above in the search for the primal substance.

#### PHYSICAL PROPERTIES.

We come now to the consideration of the physical properties of bodies at low temperatures. Dewar has shown that the tensile strength of metals is increased at the temperature of boiling oxygen. With regard to optical properties, it has already been stated that the action of bodies on light does not cease at the lowest known temperatures. Indeed, in the case of oxygen the action is so similar to that of the gas that the inference has been drawn that the molecules of liquid oxygen are of the same degree of complexity as those of the gas. In the solar spectrum there are, towards the red end, two dark lines known as A and B, which are supposed to be due to oxygen—either to that in the earth's atmosphere, or, less probably, to oxygen round the sun. Dewar has found that when liquid oxygen is interposed in the path of the electric beam, these two lines, A and B, come out in the spectrum. Olszewski, though he used a volume of liquid oxygen 50 m.m. deep and 30 m.m. thick under atmospheric pressure, failed to detect the band at B; that at A, however, was distinctly marked. It is worthy of remark that in the solar spectrum, A is nearer to the red end, and is much more distinct than B. A and B are not the only lines or bands seen in the absorption spectrum of oxygen. Both the liquid and the gas show a series of five bands situated in the orange, yellow-green, and blue of the spectrum. As to the radiation spectrum so no difficulty was experienced owing to the extremely high electrical resistance of liquid oxygen. With a powerful induction coil sparks would not pass through a thickness of liquid greater than 12 m.m. With a less thickness a series of sparks passed, but the spectrum was continuous with bright lines at intervals. It appeared to be largely due to particles torn from the electrodes by the current. By introducing a Leyden jar into the circuit, and arranging the electrodes so that the sparks passed partly through the liquid and partly through the gas immediately above it, the discharge took place more easily, and the continuous spectrum became, relatively to the lines, less bright. The most prominent lines were those in the green and yellow-green. The lines in the blue, and especially in the orange, were very faint. One of the lines in the yellow-green ( $\lambda 557$ ) is considered to be of some interest, because it falls very near the place of one of the auroral lines. It is noteworthy that the conditions obtaining during these spectrum observations of liquid oxygen resemble those under which the aurora is produced. Nevertheless, great stress cannot be laid upon this approximation; it has been sought on similar grounds to connect the auroral light with the nitrogen or the argon of the atmosphere. Dewar has also observed the spectrum of liquid nitrogen. Without the Leyden jar a banded spectrum is obtained. When the jar is introduced into

the circuit the character of the spectrum changes, and a line spectrum is seen. Olszewski remarks concerning the absorption spectrum of oxygen that it is quite in accord with the blue colour of the liquid. In order to show that the colour was proper to the oxygen and not due to impurities such as ozone or chlorine, he tested the liquid with potassium iodide and starch, and found no ozone reaction. Neither was the colour affected when the liquid was left in contact with sticks of potash. In view of the inactivity of bodies at low temperatures one is inclined to doubt the value of these tests. But there seems little reason to disbelieve that oxygen possesses a bluish colour. Olszewski considers that the colour of liquid oxygen supports the idea that the blue colour of the sky is due, partly, at all events, to the selective action of atmospheric oxygen on the rays of light.

(To be continued.)

### THE SALFORD SEWAGE SCHEME.

THE scheme by which the Borough Engineer proposes to treat the Salford, Pendleton, and district sewage at the Mode Wheel works has been presented to the Corporation River Conservancy Committee. The following are the principal provisions as set forth in the report:—

"I now submit to you a second revision and improvement of the scheme that I submitted in April, 1894. Since that date I have had the advantage of submitting my scheme to the criticism of many experts, including the four firms of civil engineers whom you consulted, the engineers of many local authorities, several inspectors of the Local Government Board, officials from the celebrated experimental sewage works in Massachusetts, and several American and Continental engineers. From each of these gentlemen I have gained valuable information, and from nearly all of them I have had expressions of approval of the main principles and the special details of my scheme. You have already approved and carried out my suggestion for uniting the whole flow of sewage along the central channel. You have, by resolution of 21st August, 1894, approved my suggestion for forming five of the six northern precipitating tanks into one long tank, divided only by dwarf walls. You also decided to alter five of the six southern precipitation tanks into isolated tanks for the continuous upward flow system; but I hope you will reconsider this decision, as about £500 might be saved by making these tanks as above described for the northern tanks. You have also, by resolution on 21st August, 1894, approved of the principle of 'roughing filters,' and you have received the full sanction of the Council, in May, 1894, to your adoption of the principle of filtration of the effluent from the precipitating tanks. You have contracts on hand for almost all the plant required on the sewage works in connection with the loading of your sludge steamer, and this steamer is working most satisfactorily in the disposal of the sewage sludge by carrying it out to sea; so that branch of my scheme may be considered as settled.

"The structural requirements for the complete treatment of the sewage, now awaiting your consideration, are thus narrowed down to three subjects—(1) the removal of sludge from the precipitation tanks, and this you have decided must be done by one of the systems which will not interrupt the continuous use of the tanks; (2) the provision of 'roughing filters' for straining particles of solid matter from the tank effluent; (3) the final filtration of the clarified effluent. As the flow of sewage has recently increased very considerably, I base all the following estimates on an average daily flow of 12,000,000 gallons. As to the first subject, the removal of sludge from the precipitating tanks, I have recently submitted to you a complete and novel scheme for this purpose, by means of a travelling scoop, a pontoon with traversing gear, and pliable pipes to convey the sludge to iron pipes leading to the open channel for filling the new sludge tanks. Experiments on a large scale have been made with a rough model of this apparatus, and the three engineer members of the Council whom you consulted on the subject have recommended you to adopt this scheme. My estimate of the cost of this apparatus, when applied to all the precipitating tanks, together with the pipes and channel to the new sludge tanks, is about £924, and the estimated annual cost of working, including depreciation, &c., about £355—equal to 1s. 8d. per million gallons of sewage. The adoption of this apparatus would allow of using all the precipitation tanks continually, and would thereby allow of a great saving in the quantity of chemicals used. As to the second subject, the provision of roughing filters, the long-continued experiments with the model roughing filters, dealing with 12,000 gallons per square yard per day, and cleansed by upward washing and surface raking, have completely proved the efficiency of such simple and inexpensive filters for removing any visible particles of solid matter from the tank effluent. It was found practicable to run these filters at the rate of 40,000 gallons

per square yard per day, with a head of about two feet of water, over a filter of three feet of sand; but, of course, the efficiency of the filter is greater with the more moderate flow. In the scheme now submitted an area of about 2,040 square yards of roughing filters is provided, by forming six separate filters in the two easterly tanks of the existing twelve precipitation tanks. The cleansing of these filters by upward flow and surface raking, and occasionally by a thorough turning over and washing of their sand, would only occupy a small portion of the time for each filter; but, even allowing for one filter being out of use and only five at work, when dealing with 12,000,000 gallons of sewage per day, the average flow would be only 7,048 gallons per square yard per day, so these filters could readily treat an increased flow in rainy weather up to three or four fold the ordinary flow. I provide for the mechanical cleansing of these filters by an engine and sand-washing machinery, travelling on rails on the filter side walls. I estimate the cost of the preparation of these roughing filters, with their channels, valves, sand, &c., and including the sand-washing engine, at about £4,820., and the annual working expenses, &c., at about £644.—equal to 2s. 11d. per million gallons of tank effluent rough filtered. The work done by these filters would be somewhat similar to that done by the coke-breeze filters at the Glasgow sewage works, or the 'clarifier' at the Swinton sewage works, or the Riddell filters tested at the Salford sewage works. The borough analyst's report of numerous analyses of effluents from the experimental roughing filters on this system show an almost complete removal of all matters in suspension, and a slight reduction in the albumoid ammonia as compared with the tank effluent before rough filtering. It would require but a short time to construct these roughing filters and thereby provide for materially improving the effluent from the existing precipitation tanks. This would remove all serious grounds of complaint during the longer time required for the full completion of the works, and would permanently provide for a fairly efficient treatment of any excessive flow of sewage, short of such a flow as would dilute the sewage matter so much as to permit of its discharge into the river without treatment. As to the third subject, the final filtration of the clarified effluent, we have now the advantage of knowing the results of a great number of experiments, and of several installations of artificial filters at sewage works. The long experience in waterworks filters may also be made available, as their duty is often very similar to that of filtering the clarified effluent from sewage precipitation tanks—as, for instance, at many London waterworks where Thames water is filtered, or formerly at Wakefield, where for a score of years the town's water supply was drawn from the foul river and filtered through a couple of filters used and rested alternately, filled with sand and magnetic carbide, a material similar to that now called polarite. Until recent years the remarkable efficiency of these Wakefield filters was generally credited to their special material, but recent scientific investigations prove conclusively that it was the intermittent use of these filters which rendered them so efficient, by inducing a growth of air-breathing bacteria, which transformed the offensive sewage elements into harmless products. The new waterworks filters at Laurence, Massachusetts, are definitely constructed on this aerating principle, and have given wonderfully good results. The long-continued experiments at the Laurence experiment station of the Massachusetts State Board of Health have clearly proved that sand filters, duly aerated by intervals of rest and drainage, will permanently purify sewage. But these experiments also show that certain insoluble substances gradually accumulate in such filters, and a glutinous substance formed by aggregations of bacteria also accumulates, and that the sand, or other material, must be washed or otherwise renovated sooner or later, the period depending directly on the quantity of sewage matter passed through the filter. Your long-continued experiments on precipitation, followed by intermittent filtration, at the Salford Sewage Works gave similar results.

"The mass of information obtained from these numerous investigations all indicates that the essentials of an efficient sewage filter are—(1) A hard, granular, durable material, free from very fine particles, such as sharp sand with the finest grains riddled out, or coke breeze, or cinders, or crushed brick with the fine dust riddled out; (2) arrangements for intermittent use, with thorough drainage and aeration in the intervals of rest, at least once a day, and preferably many times a day; (3) a flow of not more than 1,000 gallons per square yard per day while in use, with 5ft. depth of filtering materials. On these principles I have designed the aerated filters. The clarified effluent from the roughing filters would be carried by three separate main pipes to the aerated filters, each pipe having a controlling valve, so that one-third or two-thirds of the area can be shut off for aeration while the remaining part is in use, and thus each third of the area would be aerated once a day, or oftener. The filters are arranged in three sections, about 44 yards clear width, and averaging 164 yards in length, a total area of 20,640 square yards, providing for the filtration of 12 million gallons per day, at the rate of 582 gallons per yard of total filter area. The filters are spaced into breadths of eleven yards by lines of tram rails and gangway planks, supported on cast-iron pillars, which also form conduit pipes leading up to the distributing

pipes presently described. The filtering material would be sand, coke breeze, cinders, brick dust, crushed stone, or any other hard, granular, durable material, of 5ft. depth, but with height of walls, &c., ready for adding material to 8ft. depth if required. The clarified sewage would be distributed over the surface of the filters by a network of iron pipes with spray jets, and the filtered effluent would be collected into a 4ft. culvert, under a road alongside the southern boundary fence. This culvert would discharge into a small fishpond, where the pure quality of the effluent would be always visible, and from thence it would pass over a long weir on one side of the intercepting sewer outfall culvert, and so into the Ship Canal. A sandwashing engine, similar to that to be used on the roughing filters, would be in constant use on these aerated filters, washing and opening up the sand so as to continually renovate the filters by removing the insoluble particles and glutinous matter, which tend to choke any filter which is not periodically opened up and cleansed throughout. I estimate that it will be necessary to wash the top layer of filtering sand every six months, the next layer every twelve months, and the bottom layers every two years, and the sand-washing engine proposed is quite capable of doing this work during ordinary working hours.

"Having carefully revised my drawings for the walls, pipes, &c., about these filters since the date of my scheme of April, 1894, I have also provided for more substantial and durable structure than in my first plan, and have estimated the cost afresh in detail throughout. In my opinion the cost of the 20,640 square yards of aerated filters shown on the plans, together with their pipes, valves, culverts, pond, &c. complete, would be about £19,390. The filtering material would cost about £6,900, and the sand-washing engine £600, a total of £26,890. The annual cost of working, and of interest, sinking fund, &c., would be about £2,423, equal to 11s. 1d. per million gallons filtered. I have said nothing hitherto as to the chemicals to be used for the precipitation process, and the machinery, &c., for applying them. There are so many chemical systems, any of which might serve our purpose, that I need not attempt to select one now. But I wish especially to call your attention to the well-proved fact that roughing filters alone, without any tanks or chemicals, can remove 50 or 60 per cent. of the impurities of sewage. In fact such filters can do quite as much clarifying as any ordinary precipitation process. It will therefore be practicable, when the roughing filters are at work, to considerably reduce the quantity of chemicals used. It will also be practicable, by providing more storage space for chemicals, to purchase by the ship load at reduced prices; and by substituting simple lifting and mixing machinery for the excessive amount of hand labour now employed further economies may be effected, so that the total cost of chemicals, machinery, and labour for the precipitation process would not exceed 15s. per million gallons, say thus—5 cwt. sulphate of iron at 1s., 10 cwt. lime at 8d., and 3s. 4d. by 12 equals 40s. per day for the wages of ten men. I propose utilising the outer walls of the existing turbine chambers and overflow shoot, which will be put out of use by the proposed filtration scheme, erecting over them a building to match the lime-mixing house, which would have a basement capable of storing a ship load, say 500 tons, of chemicals, and a ground floor where additional mixing machinery could be placed. The estimated cost of these alterations is given, together with that of altering the tanks and the foregoing special items of estimate for filters, in the estimate of the total expenditure required, amounting to £35,018. The total annual expenditure on sewage treatment, apart from sewage pumping and sludge disposal by steamer, is estimated at £6,870, equal to 31s. 5d. per million gallons of sewage treated.

"It will be seen that this estimate is considerably below any of the tenders which offer sufficient plant to adequately deal with a flow of twelve million gallons per day; and as I am quite certain that no equally efficient system has been submitted to you, I hope you will carry out in its entirety this scheme, of which you have already accepted so many parts. This is the practical outcome of your long-continued experiments, and as such would be sure of the favourable consideration of the Local Government Board. The complete adoption of this scheme and the avoidance of any handing over of your sewage works to patentees or speculators would be a true economy; and would most amply repay the time and attention given by your committee during the past six years to the long series of experiments on an unprecedented scale by which you have done more than any other local authority to finally solve the sewage problem in manufacturing districts."

In a footnote to the report the borough engineer adds:—"The above report omits, by direction of the committee, an addendum describing the works of road forming and paving, tramways, flood-water conduits, workshops, and other structural works not directly connected with the treatment of sewage, the estimated cost of which is about £10,140.; also the amount of expenditure already authorised for the sludge steamer, sludge tanks, sludge pumps, and ~~collateral~~ works, amounting to £15,250."

## THE SPECIAL RULES FOR DANGEROUS OCCUPATIONS.

### II. — ELECTRIC ACCUMULATOR WORKS AND ENAMELLING.

In the manufacture of accumulators the chief danger lies in the mixing of the dry red lead and the litharge used with sulphuric acid. In rubbing these mixtures into the embossed leaden plates there is also a risk of lead poisoning through the pores. Gloves are employed, but they do not afford great protection. By the judicious use of the following method the workers might greatly reduce the risks. A piece of lead with small arms branching from it fits into a mould, and the red lead paste is put into the mould with it, and rubbed in tightly with a presser or roller. The mould is then placed on a drying tray for a few moments. When thus slightly dried, the piece of lead with the moulded paste adhering to it readily separate from the mould, which is used afresh. The principal need for care and provision is in the mixing of the pastes. By the use of respirators and ordinary care, however, the risk even in this department can be reduced to a state of practical safety. The recommendations of the Committee of Inquiry support this assertion, as they were but three in number. The first two emphasise the necessity of the employees using to advantage the respirators and gloves provided. The third ensures the provision of accommodation for washing. The following are the special rules now in force:—

#### DUTIES OF OCCUPIERS

They shall provide a bath and lavatory accommodation, with a plentiful supply of hot and cold water, soap, nail brushes, and towels.

They shall provide respirators and overall suits for all persons employed in the operation of mixing.

They shall provide gloves and aprons for all persons employed in the occupation of rubbing.

They shall see that the gloves are constantly inspected and renewed when defective.

#### DUTIES OF PERSONS EMPLOYED.

In cases where the co-operation of the workers is required for carrying out the foregoing rules, and where such co-operation is not given, the workers shall be held liable in accordance with the Factory and Workshop Act, 1891, section 9, which runs as follows:—"If any person who is bound to observe any special rules established for any factory or workshop under this Act, acts in contravention of, or fails to comply with, any such special rule, he shall be liable on summary conviction to a fine not exceeding two pounds."

Respirators: A good respirator is a cambric bag with or without a thin flexible wire made to fit over the nose.

#### ENAMELLING

is largely confined to the treatment of iron plates for advertisements and other purposes, and the preparation of enamelled and tinned hollow ware. In the sifting on and colouring processes there is little risk, and what there is can be easily obviated. In the execution of the design in the case of plates, the partially fixed enamel is removed by a scratch brush after applying a stencil. The dust thus generated is objectionable, and this process is repeated according to the number of colours required. Lead compounds enter largely into the composition of nearly all the enamels, and hence the risk of lead poisoning. One death was investigated by the Committee. Their findings were by no means wholly condemnatory. It is pleasing to learn that one of the largest enamelling firms has found the new regulations favourable. They can get the respirators worn with a fair amount of regularity, and as there has not been a case of illness for a long time past further trouble is not expected. The most drastic of the Committee's recommendations were the excluding of females under 20 from the brushing room, the supplying of half a pint of milk and a biscuit for each female prior to starting work, and the use of fans on the perforated brushing benches. The other recommendations were much the same as for other lead industries. In connection with the tinning of hollow ware, there was no very important addition to the then existing rules, but in the enamelling of hollow ware for culinary purposes the prohibition of the use of lead or arsenic was suggested. The existing rules for enamelling iron plates are as follow:—

#### DUTIES OF OCCUPIERS.

They shall provide washing conveniences, with a sufficient supply of hot and cold water, soap, nail brushes, and towels, and take measures to secure that every worker wash face and hands before meals and before leaving the works.

They shall provide suitable respirators, overall suits, and head coverings for all workers employed in the processes of grinding, dusting, and brushing.

They shall adopt measures in the dusting and brushing processes for the removal of all superfluous dust, by the use of perforated benches or tables supplied with fans to carry the dust down through the apertures of such benches or tables, the under part of which must be boxed in.

They shall provide a sufficient supply of approved sanitary drink, and shall cause the workpeople to take it.

They shall arrange for a medical inspection of all persons employed at least once a month.

They shall see that no female is employed without previous examination and a certificate of fitness from the medical attendant of the works.

They shall see that no person who has been absent from work through illness shall be re-employed without a medical certificate to the effect that he or she has recovered.

Upon any person employed in the works complaining of being unwell, the occupier shall, with the least possible delay, and at his own expense, give an order upon a doctor for professional attendance and medicine. It is to be understood that this rule will not apply to persons suffering from complaints which have not been contracted in the process of manufacture.

They shall provide a dining-room, and a cloak-room in which the operatives can hang up the clothes in which they do not work.

They shall see that no food is eaten in the works, except in the apartment specially provided for the purpose.

They shall provide for each female before the day's work begins some light refreshment, such as half-pint of milk and a biscuit.

#### DUTIES OF PERSONS EMPLOYED.

Every person to whom is supplied a respirator or overall and head covering shall wear the same when at the work for which such are provided.

Every person shall carefully clean and wash hands and face before meals and before leaving the works.

No food shall be eaten by any person in any part of the works, except in the apartment specially provided for the purpose.

No person may seek employment under an assumed name or under any false pretence.

The advice concerning the respirator and the sanitary drink suggested are exactly the same as given last week under the rules for white lead, etc.

The rules appertaining to tinning and enamelling hollow ware are:—

#### DUTIES OF OCCUPIERS.

They shall provide washing conveniences with a sufficient supply of hot and cold water, soap, nail brushes, and towels; and take measures to secure that every worker wash face and hands before meals and before leaving the works.

They shall provide a dining-room, and shall see that no food is eaten in the works except in such dining-room.

#### THE DUTIES OF PERSONS EMPLOYED

are exactly the same as those given under Accumulator Works. These rules as a whole appear to be working as satisfactorily as any of those resulting from the last inquiry, but communications on any points which are held capable of emendation are invited. Similar information concerning any changes that may appear probable owing to the action of the Committee of Inquiry now sitting (*vide C.T.J.*, 444, p. 319) will be equally welcome.

LAUTARO NITRATE CO., LTD.—The directors announce an interim dividend on account of the year 1895 at the rate of 10 per cent. per annum (5s. per share), free of income tax, payable on January 1. The directors take the opportunity of making the following communication to the shareholders:—"In connection with the attitude of this company towards the proposed combination of nitrate makers, a great many misleading statements, and amongst them some allegations absolutely devoid of truth, have lately been made through the press, at public meetings, and otherwise, by persons interested in other nitrate companies or in the temporary rise of nitrate of soda or shares. Consequently, while confident that the shareholders will put the right value on such interested attacks, the directors are anxious to assure the shareholders that the subject of combination is engaging their constant attention, and that whenever they may be able to agree to any arrangement by which the interests of this company will not be sacrificed to speculation or outside interests, they will gladly accept it. They also beg to inform the shareholders that they have, from the beginning, done all they could to assist in bringing about a sound Combination, as is evidenced from their correspondence for over six months with the parties interested. So far, however, the indispensable precautions suggested by your board have been disregarded, for various but, in the opinion of your directors, insufficient reasons."

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

Production and Automatic Distribution of Acetylene Gas. W. Synncock and G. Gosling. 24,088. December 16.  
Process and Apparatus for Manufacture of Sulphur Dioxide and its Derivatives. J. Enright. 24,127. December 17.  
Improvements in Softening Water and Compositions therefor. G. D. Yates. 24,168. December 17.  
Manufacture of Ammonium Salts. J. H. Darby. 24,171. December 17.  
Apparatus for Manufacture of Acetylene Gas. E. B. Pym and J. Gore. 24,196. December 17.  
Process and Apparatus for the Manufacture of Ozone. C. J. Varnold. 24,289. December 18.  
Manufacture of Nitrogenised Water. H. J. Haddan. 24,297. Dec. 18.  
Cleansing and Manipulating the Material used in Filter Beds for Sewage, etc. J. Corbett. 24,378. December 19.  
Separating and Purifying Colouring Matter from Crude Cottonseed Oil. E. S. Wilson and E. Stewart. 24,418. December 20.

Treating Potato Starch with Chlorine. C. Hellfrisch. 24,456. Dec. 20.  
Hydraulic Oil Seed Presses. G. P. Wallis. 24,499. December 21.  
Improvements in Purifying or Filtering Oils, Saccharine Solutions, Water, Sewage, etc. G. MacDonald. 24,544. December 21.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal and ALL RIGHTS of publication are RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements Relating to the Removal of Suint from Wool, Recovering or Separating certain Constituents from the Suint, and Obtaining Valuable Products therefrom. H. E. Newton, 6, Bream's Buildings, Chancery-lane, London (communicated by J. H. Wingfield, Montclair, Essex, New Jersey U.S.A.). Eng. Pat. 20,433. Oct. 29, 1895.

The crude suint is extracted by means of warm heavy petroleum. The exact quantity of the solvent is immaterial so long as there is sufficient excess to ensure perfect extraction, which virtually amounts to  $\frac{3}{4}$  gallon to each pound of wool. The nature of the heavy petroleum is, however, of more importance. Oils rich in the aromatic hydrocarbons impart a distinctive and objectionable smell, for which reason American is preferable to Russian oil. In general, uncracked or so-called neutral oils give better results than cracked oils, for the powers of solution decrease as the refining of the oil proceeds, burning oils being less extractive, and naphthas and benzenes still more so. At the same time, the oils should not be too heavy. Thus oils as heavy as 26° Bé and upwards are not desirable, while with oils as light as 47° Bé and lighter, the product is neither so great as when the heavier oils are employed, nor do they wash out of the wool so readily. The extraction is effected at 120°F.

The extracted wool is then drained from the solvent, and the remainder removed by expression between rollers. The final cleansing is effected by the combined aid of a hydro-extractor and a weak, warm solution of alkali.

The solution of crude suint is drawn off and freed from dirt by filtering, after which it is allowed to cool, when the cholesterol group of the constituents of the suint practically separates entirely. There is also a second layer of liquid, dark brown in colour, and of a bad odour. This latter is highly useful as a leather oil, readily forming an emulsion with water. It also forms a good lubricant. One of the main advantages lies in the fact that the extraction can be carried out in open vessels in woollen mills without the necessity of heating the solvents to a dangerous point, or of cooling them artificially to ensure the separation of the cholesterol group, as the highest temperature required is 120°F., and cooling to the temperature of the surrounding air is enough to accomplish the latter end.

**New or Improved Method of Sewage Precipitation.** G. C. Purvis, 3, Buccleugh-place, Edinburgh. Eng. Pat. 20,366. Oct. 29, 1895.

This invention proposes to add carbon dioxide to sewage, and then sufficient milk of lime to ensure the complete removal of the gas, taking care that the excess of lime is small enough to render the sewage only slightly alkaline. The small excess of lime is generally utilised in precipitating the organic matter in the sewage.

A general guide to the quantities required can be gathered from the following data, which apply to a neutral sewage:—

Six to 12 grains  $\text{CO}_2$  are used to each gallon, and 8.5 to 16 grains of lime ( $\text{CaO}$ ). With sewages which are very foul owing to the presence of  $\text{H}_2\text{S}$ , sulphur dioxide is also employed, an equivalent of lime to effect neutralisation being added as in the case of  $\text{CO}_2$ .

**Improved Method of Producing Magnetic Oxide on Wrought and Cast Iron.** P. H. Bertrand, 12, Rue Violet, Paris. Eng. Pat. 23,855. Sept. 1, 1895.

The process consists in preparing an adhesive varnish, with which the article to be coated with magnetic oxide is covered, and then heated to a high temperature.

The varnish is made by adding one per cent. of  $\text{MnO}_2$  to a vehicle like oil, and boiling the same until the sesquioxide ( $\text{Mn}_2\text{O}_3$ ) is obtained. The object to be treated is then cleaned and coated with the varnish, which is thinned to a convenient consistency with more oil. After being allowed to dry, the article is heated in a furnace to 800° to 1,000°C., whereby a coating of  $\text{Mn}_2\text{O}_3$  is imparted. The thickness of the layer largely depends upon the time devoted to furnacing.

Other vehicles and substances can be employed, as, for instance, an aqueous solution of manganese acetate or cobalt oxides, with which good results have been obtained. The oil and  $\text{MnO}_2$  method is recommended, however, as being the simplest, most practical, and least costly.

## THE HAT-MAKING INDUSTRY IN 1895.

THE felt hat manufacturers in Denton, Stockport, Hyde, and other hatting towns about Manchester report having experienced a very indifferent year. The severe weather experienced during the early months of the year very much hindered the opening out of business, and Easter and Whitsuntide brought comparatively few large orders. The ladies' felt hats have increased in popularity, and proved a good thing for those manufacturers who had made special arrangements for dealing with this class of work. The most taking thing produced in men's styles has been the soft-framed felt hat, and it is generally thought that there will be a great run on this make in the new year. These hats are produced in all kinds of shades, a fact which increases the demand, as the tendency in the domain of fashion generally is to favour the brightest of colours. Silk hatters have rarely, if ever, had a better year, and orders are booked long ahead. The bell-shaped silks are likely to have a very long run, being far more acceptable to the public than the "stove-pipe" style. Many of the hat manufacturers have been very hard hit by foreign competitors, but the Board of Trade returns up to the end of October show that the shipping trade in hats has increased, compared with the previous year. In 1894 the exports for the ten months ending October were 987,606 dozens, value £833,000.; similar period this year, 1,032,296 dozens, value £928,979. The average value per dozen in 1894 was 16s. 10½d.; this year it was increased to 18s. The shipping trade has suffered considerably from the heavy duties imposed by the colony of Victoria. Efforts have been made to get the duty reduced, with the result that the duty on felt hats now stands at 30s. instead of 36s. per dozen, but the duty on silk hats still remains at 60s. Hatter's machinists report a good year's trade, and most of the workshops are still busy, and have a good outlook. A great deal of the machinery used in the East and on the Continent is made in the Manchester district, and, with home orders to execute, the machinists have had a good run for some years. No serious dispute has taken place in the hat trade during 1895, but it is understood that the action of certain employers opening works in the Atherstone district is causing considerable dissatisfaction, it being contended by the men's union that the object in view is simply to avoid paying trade union wages and get the advantage of female labour. Labour disputes have in the past had a most disastrous effect upon the English hat trade, and it is to be hoped that during 1896 any differences between employers and employed will be amicably arranged.

**SOCIETY OF CHEMICAL INDUSTRY.—London Section:** A meeting of the society will be held on January 6th, at Burlington House, at 8 p.m. A paper will be read by Mr. Watson Smith on "A technological study of comparative affinities in the case of certain salts of ammonia," and by Mr. Lovibond on "Colour effect of lime salts on hops in brewing."

**AN OLD PUPIL OF JOHN DALTON.**—Miss Taylor, who recently died at Moston, in her ninety-second year, was a member of an old Moston family, and in the early part of the present century her father, Colonel Taylor, was well known as an active magistrate and colonel of Volunteers. Her nephew, Mr. Henry Taylor, has been well known as a solicitor in Manchester for many years. The deceased had great talents and many accomplishments, and possessed a very extensive knowledge of botany. She was a pupil of Dr. John Dalton, who by his will, dated in 1844, left her a legacy in the following words:—"To my highly esteemed pupil and most agreeable friend, Mary Taylor, of Moston, one hundred pounds, as a testimony of the pleasure I have had in the instruction of one of such superior abilities." Among her papers were several autograph letters from the same distinguished scientist.

## Trade Notes.

**SOCIETY OF CHEMICAL INDUSTRY.—Liverpool Section:** The next meeting of this section will be held on Wednesday, January 8th, at 7-30 p.m., when a paper will be read by Dr. J. T. Conroy on "Some experiments relating to the manufacture of cyanides."

**SERIOUS DISAGREEMENT IN THE OIL TRADE.**—The Standard Oil Company of America has declined to fulfil its engagement to take up a quantity of paraffin scale which could not be otherwise disposed of from one of the Scottish oil companies. The reason given for this breach of agreement is that the candlemakers' combination has broken down in consequence of underselling by Scotch makers, and on this account the Standard Oil Company is no longer in a position to maintain prices. It is feared that this action on the part of the Standard Oil Company will terminate the agreement between Scotch and American producers. The result of this can scarcely fail to be a renewal of keen competition, cutting of prices, and consequent depreciation of the oil companies' shares.

**WOOD AND WOOD PULP VIA THE CANAL.**—Several large cargoes of wood pulp and timber are either due or have arrived in the Manchester Docks from Norway and Sweden during the last few days. Amongst these are heavy shipments from Christiania by the steamers *Oda* (506 tons) and *Vanadis* (699 tons), both of which left that port on the 2nd ult., but were damaged by the gale and had to put back to shelter and refit. On the 19th ult. the steamer *Frigga*, 212 tons, left Christiania, and on the 20th the *Skulda*, 308 tons, left Gothenburg, both with full cargoes, for this port, whilst the *Dalbeattie*, 849 tons, has a similar shipment from Skutskar, which port she cleared on the 18th ult. The Danish steamer *Fano* left Stettin for Manchester on the 20th ult., via Copenhagen, and was to sail hence again for those ports about the 3rd inst. The *Auckland* and *Constance*, of Messrs. Felber, Jucker, and Company's new line from Sweden and Norway, were due this week, and would receive general cargo here for Gothenburg and Christiania, sailing on the 3rd and 12th January respectively. The steamer *W. Harkess*, 736 tons, from Kotka, has been anchored in the Sloyne for several days, bound for Manchester.

**UNLAWFUL COMMISSIONS.**—The hero of "Tom Brown's School-days," when inspiration ran short in the manufacture of Latin verses, was accustomed to fall back on the fine moral apostrophe, "*O genus humanum!*". The same sentiment has often to be invoked in maturer years. "Ye'll find mankind an unco' squad," says Burns, "and muckle they may grieve you." Muckle they have been grieving the Lord Chief Justice with illicit commissions. The Lord Chief Justice has a large experience of life, but even he was not prepared seemingly for a witness's frank avowal that if a traveller was not prepared to spend money freely in bribing foremen and managers he would get no orders either in the dyeing or most other trades. The Lord Chief Justice was shocked and scandalised, but he was able to cap the witness's experience by his own, which was that an unbribed manager would mix ingredients with the dye to spoil goods and discredit the supplying firm. This is blacker still. But the law is not to blame. Everyone knows, or ought to know, that this corruption of agents or persons in a position of trust is entirely contrary to law—that the receiver is not only accountable to his employer for the bribe, but liable to instant dismissal. The law can do no more. It is the old story. "*Quid leges sine moribus?*"—*Law Journal*.

## Market Reports.

### MISCELLANEOUS CHEMICAL MARKET.

Business is active in all branches of the alkali trade, and prices are strong. Caustic soda for export is, if anything, rather firmer, and prices, f.o.b. Liverpool, for prompt and forward delivery, are as follows:—F.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 10s.; 70%, £7. 10s.; 60%, £6. 10s., net, 10-ton lots and upwards. Ammonia alkali, 58%, in good demand, and market firm at £3. 7s. 6d. per ton, bags, f.o.r. makers' works. Soda crystals unchanged in value. Leblanc soda ash finds moderate sale at 1d. per degree, casks, f.o.b. Liverpool. Bleaching powder is selling freely, and there is good inquiry for forward delivery: Price firm at £7. 5s. f.o.r. makers' works; contracts over the year, £6 15s.; and f.o.b. Liverpool, for export, £7. 5s. to £7. 7s. 6d., in hardwood casks. Chlorate of potash, 4½d. per lb. Soda, 6½d. per lb., with little change in the position of the market. Sulphate of copper, £16. to £16 5s. f.o.b. Sulphur, still without any improvement in value, and selling freely at £3. 12s. 6d., makers' works, in bulk. Nitrate of soda steady on the spot, at 7s. 6d. to 7s. 7½d. per cwt. Brown acetate of lime, £5. to £5. 5s. c.i.f.; supply is still in excess of demand. All other acetates

are, meantime, weak. Potash, caustic, and carbonate are in good demand, both for prompt and forward delivery, and values are firmly maintained. Arsenic nominal at £15. 15s., net. Garston yellow prussiate of potash, 7¼d. to 8d. per lb. Aniline oil and salt have rather a firmer tendency. Carbolic acid crystals very firm at 6½d. Sulphocyanides quiet; prices unchanged. Trade still continues quiet in many branches, and no doubt this is to some extent due to the holiday season.

### TAR AND AMMONIA PRODUCTS.

Benzols continue firm at 2s. 3d. for 90's and 2s. for 50'90's. There is practically no change in the other products, owing to the intervention of the holidays, but the general outlook inclines to a firm market. Carbolic acids are steady, with 60% crude at 1s. 9½d.; crystals unaltered. Crude naphtha 10d., and solvent 1s. 6d. Pitch steady at 37s. f.o.b., East Coast.

Sulphate is quiet. There is some selling for next month reported in the North at £8. 12s. 6d. Current values for prompt are:—Beckton £9., London outside makes £8. 12s. 6d., Liverpool £8. 12s. 6d., Hull £8. 11s. 3d., and Leith £8. 10s. to £8. 11s. 3d. Nitrate quiet.

### REPORT ON MANURE MATERIAL.

There is still a holiday tone about the market, and business done has not been on any extensive scale. Quotations for mineral phosphates are unchanged. For shipment during first half of the year sellers seem wishful to be making sales, but for later shipment they are not so anxious, current prices being unremunerative, and therefore offering no inducement to sell very far ahead. There is rather more inquiry for cargoes of River Plate bones, and the value may be put at £3. 15s. to £3. 16s. 3d. per ton, according to size and position. Crushed Kurrahee bones offer on spot at £4., without finding buyers. For shipment, £3. 17s. 6d. is now asked for Bombay bone meal, but a shade less would probably be business for good lines. Nitrate of soda is steady at 7s. 7½d. per cwt. for ordinary quality, and 7s. 9d. for refined, on spot. Due cargoes are worth about 7s. 7½d. for ordinary quality, but the prospects of effecting a Combination of raisers being now encouraging, higher prices are being paid for summer shipment. There is nothing special to report in miscellaneous material.

### THE METAL MARKETS.

**LONDON, WEDNESDAY.**—Pig iron, weak: Scotch warrants closed at 45s. 4d.; Middlesbrough, 36s. 5d. cash, and hematite, 46s. 3½d. Copper, firm: Chili bars, G. O. B.'s and G. M. B.'s closed at £41. 2s. 6d. to £41. 7s. 6d. cash, and £41. 10s. to £41. 15s. three months. Tin, weak: Straits closed at £59. 12s. 6d. to £60. 2s. 6d. cash, and £60. 2s. 6d. to £60. 12s. 6d. three months. Australian, £60. 7s. 6d. English ingots, £63. Lead, firmer: Spanish, £11. 6s. 3d.; English, £11. 10s. Silesian spelter, ordinary, £14. 10s. Nickel, 1s. 1½d. Antimony £30. 5s. Quicksilver: first hands, £7. 7s. 6d.; second hands, £7. 4s. Copper shares, steady: Cape, 1½ to 2½; Copiapo, 1½ to 2½; Libiola, 2½ to 2½; Mason and Barry, 2½ to 2½; Rio Tinto, 14½ to 14½; Tharsis, 4½ to 4½.

**GLASGOW, TUESDAY.**—Market flat, with good business. Scotch done at 45s. 4½d., 45s. 3½d., and 45s. 4½d. cash, also at 45s. 7½d., 45s. 5½d., and 45s. 6½d. one month; closing with buyers at 45s. 4d. cash, sellers ask 45s. 4½d. Cleveland done at 36s. 5½d. cash; closing with buyers at 36s. 5d. cash, sellers ask 36s. 5½d. cash. Cumberland hematite done at 46s. 3d. cash, also at 46s. 6d. one month; closing with buyers at 46s. 3½d. cash, sellers ask 46s. 4d. Middlesbrough hematite done 44s. 3d. cash; closing with buyers at 44s. 3d. cash.

### LIVERPOOL MINERAL MARKET.

Our market this week, notwithstanding the usual holidays, has ruled firm, and orders have been booked pretty freely. Indeed, the fluctuations during the past year have been few, and in many cases comparatively unimportant, excepting in manganese, chrome ore, French chalk, and bauxite, in which minerals there has been a strong demand, scarcity of supply, and gradual upward tendency of price. On the other hand wolfram and scheelite somewhat receded in the early part of the year, but have recovered as prices got lower than the cost of production. These minerals are now very strong, and with a good probability of further increase in price, which may fairly be expected during the present year. On the whole the mineral trade during 1895

has been strong, with advancing prices. Manganese arrivals have somewhat improved, but as stocks have not been increased prices remain as last quoted. Ground manganese continues in good request at £6., £8., £10., and £12. 10s. per ton, according to quality. Manganiferous iron ore is unchanged at 15s. to 17s. 6d. per ton, c.i.f. Chrome ore has somewhat increased; the demand, however, for both chemical and metallurgical purposes, is largely improved, and prices are firm at 70s. to 100s. and 105s. per ton, according to grade. Bauxite: In view of the probability of increased demand in the future, prices continue firm at 20s. per ton for first, 16s. for second, and 12s. for third quality, f.o.b., in cargoes. French chalk is specially strong, notwithstanding that arrivals have been considerably increased, and prices are yet firmer: "Angel White" brands are done at 70s. to 75s., 80s. to 90s., and 100s. to 110s. per ton, according to quality. Magnesite continues slow, and is likely to be so until some increased consumption is found. Wolfram and scheelite are strong, and sales have been made at good figures. Arsenic continues with an upward tendency at £16. 10s. to £18. per ton. Fuller's earth: "Emerald" and other brands are steady at 50s. for lump, 55s. for ground, 70s. per ton for impalpable powder. Rottenstone: Prime quality is scarce, and brings full prices—£8. 10s. to £15. per ton, according to grade. Ochres and umbers continue steady: French J C ochre is done at 65s. per ton, and prime umber at 40s. per ton. Oxides of iron sell readily at £6. to £10. per ton for good staining, and prime grades at £18. to £20. per ton. Carbonate of barytes is rather easier, in consequence of the increase stocks, but this will all be required should the winter be severe, so as to prevent dressing at the mines. Sulphate of barytes: Prime quality is scarce, and brings full figures; the demand is good. Fluor and feldspars are unchanged, and the demand is steady at full prices. Emery stone is in more request, prime Turkish stone being done at 75s. to 95s. per ton, according to quality, and Naxos at last prices. Mica: The demand is steady at £15., £18. and £25. per ton for ground. Bog ore is in fair demand at 22s. 6d. per ton. Plumbago continues in strong demand, founders' qualities being done at £6. to £10. per ton, and prime Ceylon at £15. to £20. per ton. Pumice stone: Lump is steady; the demand for powdered is better at £7. to £8. per ton. Iron ore is still quiet at 10s. per ton for Irish, Spanish and other grades quiet, but firm at unchanged prices.

### LIVERPOOL OIL AND COLOUR MARKET.

TUESDAY.

**OILS.**—Palm oil is very quiet, and the market generally has not yet fully recovered from the lull caused by the holidays. There is a small business doing in olive, which is firmly held for recent rates. Linseed is easier, Liverpool makes in export casks now being quoted 20s. 6d. to 21s. per cwt., holders being steady at this price. Cottonseed is firm, with Liverpool refined 17s. 3d. to 17s. 9d. per cwt.; American unaltered. Castor oil is steady, at last week's rates, at which a quiet business has been done. First pressure French varies from 2½d. to 2¾d. per lb. Tallow shows signs of weakness, and in consequence the inquiry is improving. Resin keeps firm in price, with a fairly good demand, considering common stands at 4s. 10½d. per cwt. Spirits of turpentine are firm, and being well inquired for at 21s. 9d. to 22s. per cwt. Petroleum is still quoted 7¾d. to 8½d. for American, though the reported split in the Anglo-American paraffin combination may bring a fall in values. Russian refined, 7d. per gallon.

**COLOURS** are steady, without alteration in prices. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

### WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

This, as the last day of the year, is marked by a general closing of all those works which had not already shut down, and stoppage of production for a week, more or less, to afford space for the annual repairs necessary. The market accordingly has already assumed its holiday aspect, and transactions are at a minimum, the old prices being the rule. The combination of the three chief British producers is attracting a great deal of attention, and causing some speculation. Since last report sulphate of ammonia has been at a dead level around, £8. 10s. per ton prompt, Leith, with very little doing and nothing at all spoken of for forward. Most of the makers are understood to have

put down the foot at £8. 10s., but at the same time it is believed that £8. 8s. 9d. has been done in certain quarters. Mineral oils and paraffins are all strong, and burning oils specially are in very large delivery, with lubricating oils very steady of price, and perhaps inclined to a further rise. Solid paraffins are in moderate demand and old prices sustained.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. 10s. nett, Glasgow; caustic soda, white, 76° £9. 5s., 70/72° £7. 10s., 60/62° £6. 10s., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £6. 10s. to £7. nett, Tyne; salteake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4¼d. less 5%, Liverpool; nitrate of soda, 7s. 7½d. to 7s. 10½d.; sulphate of ammonia, £8. 8s. 9d. to £8. 10s. prompt, f.o.b. Leith; salammioniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £16. 2s. 6d. to £16. 7s. 6d., less 5%, Liverpool; paraffin scale, hard, 2½d., and soft, 1¾d. to 2¼d. per lb.; paraffin wax, 120° semi-refined, 2¾d. to 2¾d.; paraffin spirit (naphtha), 7½d. to 8d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6¾d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £4. 15s. to £5., 885° £5. 5s. to £5. 10s., and 890/895° £5. 10s. to £6. 10s. Week's imports of sugar at Greenock were nil.

### TYNE CHEMICAL REPORT

TUESDAY.

Chemicals unaltered in price, and business very quiet. There will be very little doing until after the turn of the year. Prices to-day are nominally:—

Bleaching powder, softs, £7. 5s. per ton, nett; hard, £7. 10s. per ton, nett; caustic soda, 76/77°, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 10s. per ton, nett; do., 1 cwt. kegs, £7. 5s. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. 2s. 6d. per ton, nett; blanc fixe, £7. 10s. per ton, nett; chloride of barium, £7. 10s. per ton, nett; carbonate of alumina, £28. 15s. per ton, nett; aluminate of soda, £33. 15s. per ton, nett; in 5 ton lots, £28. 10s. per ton, nett.

**SALT.**—South Durham salt is steady at 9/6 per ton, f.o.b., Tees.

**COALS.**—There is no alteration to report in prices, but there is a rather better demand for some qualities of coal, particularly gas and bunker. Collieries producing gas coals are well employed, this quality being at the very height of consumption. To-day's quotations are:—Best Northumbrian steam, 7s. 9d. to 8s. per ton; second qualities, 6s. 9d. to 7s. per ton; small steam, 3s. 9d. to 4s. per ton; household coal, 10s. to 11s. per ton; gas coals firm, 7s. to 7s. 6d. per ton; coke steady, 14s. to 14s. 6d. per ton.

### HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

**OILS.**—Linseed oil is again firmer, 18s. 7½d. naked spot month, and 18s. 6d. paid for Jan.-April and May-August. Boiled and refined £1. to £2. per ton extra. Export for week, 1,280 cwt. Refined cotton oil is dull at 14s. 10½d. per cwt. naked spot, and for Jan.-April 15s. 6d. to 15s. 4½d. and May-Aug. 16s. 1½d. Casks £1., and ordinary barrels 30s. per ton extra. The export for the week of refined oil has been 4,160 cwt. Resin is scarce, and commanding enhanced prices. Castor oil from 2½d. to 2¾d. per lb. for first pressure. Olive oil unchanged. Cod oils from £17. to £20. per ton. Boiled siccative oil, £13. per ton. Liquid soap, £16. Debloomed mineral oil for good makes cannot be bought below £8. per ton.

**CAKES.**—The consumption of linseed cakes during the year has been larger than usual. The quality of Hull-made 95% cakes has been very high, the test by analysis now frequently applied has enabled the consumer to perceive that the quality of Hull-made cakes of the best makes is unexcelled. The year opened with the price of 95% at £6. 7s. 6d., and touched the lowest price in May, viz., £5. 12s. 6d.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | ## ANNUAL SPECIAL ISSUE, 1896.

The usual Double New Year Number of the CHEMICAL TRADE JOURNAL, to be issued on January 18th, 1896, will contain a number of illustrated technical articles, in addition to the other special features of this issue. Advertisers are requested to consult our advertising columns for further particulars.

SUBSCRIBERS and others will oblige by ordering extra copies as early as possible,

ESPECIALLY for the CONTINENT and ABROAD.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

**"Expert, Manchester."**

NATIONAL TELEPHONE 3060.

Readers will oblige by making their remittances for subscriptions by Postal or Post Office Order, crossed and payable to "Davis Bros."

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than **Tuesday morning.**

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion  
Each additional 10 words ..... 0s. 6d.

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

30 Words and under ..... 1s. 3d. per insertion.  
Each additional 10 words ..... 0s. 3d. "

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff rates which will be forwarded on application.

Advertisements intended for insertion in the current week's issue should reach the office by **Thursday morning** at the latest.

## CURRENT TOPICS.

### THE SOLID PARAFFIN COMBINE.

IT is easy to prophesy, but it is not equally easy to do so rightly. At the same time a correct fulfilment of a prophecy is not always attended with complete satisfaction, for should the prophecy be an evil one, there is yet some consolation in the fact that the forecast has not been fulfilled. With regard to the Anglo-American Solid Paraffin Combine, though apparently very near the truth in the estimate which we made at the beginning of last year, we are nevertheless sorry that things should have gone so badly with this already heavily-weighted industry.

As we pointed out at the time, everything depended upon the candlemakers, they being the principal consumers, and it was easy to foresee difficulties when the prospects of the candlemakers adhering to their association were so slender. There cannot be the slightest doubt but that the Standard Oil Company were fully alive to the results that would follow the decadence of the association, and in counting thereon they did not run any very great risk.

It was not long before they began to see that things were going to fall flat, and it must have been with intense complacency that they reflected upon the successful way in which they had bribed the piper to cease playing the objectionable air of "The flash-point of petroleum to 100° must be raised," and yet so neatly contrived to burke the payment of the bribe. From beginning to end, the whole affair has been a hopeless mass of patchery, and we cannot but feel that the meetings which are to be held in London to bring together the producers and consumers, will be productive of very little good. It was openly stated in the American trade papers that on their side, at all events, there was no intention on the part of the trade to pay heed to any promises that the Standard Oil Company might be making to the Scotch wax producers, to close their mouths over the flash-point question. We presume that, had the Candlemakers' Association adhered to its original policy, the Standard Oil Company would have fulfilled their promises regarding the paraffin combine, and it only shows how confident they must have been of the issue, to enter into the agreement they did, in the face of the American trade.

There are a good many who have fully expected the latest developments, reported in the columns of our last issue, and a nice mess it has left the Scotch producers in. Looking at the matter calmly and impartially, what have they gained? It would be indeed a difficult matter to say. To our way of thinking, not only are they no better off, but, on the contrary they are, if possible, in a worse position than ever, for now they have the surplus stocks (for which there is no market, save at a poor price), which they have been counting on the Standard Oil Company taking up, in accordance with the terms of the agreement.

It is much easier to see how the Standard Oil Company have benefited. They have had a nice little boom with their dear and doubtful oil at the expense of the poor consumer, whom erstwhile they were so anxious to protect from any burdensome rise in price, through the substitution of Scotch or other paraffins for their low flash dangerous oil.

Seeing there is good reason to hope that a further inquiry into the question of what is a safe flashing point for burning oils will be made by a Parliamentary Committee during the coming Session, we would once again urge the Scotch producers to leave the Standard Company to fight their own battle, and reserve to themselves the right to speak if they wish to do so. To judge by the experience of the last 12 months, this assumption of independence can do no harm, for agreements as unstable as that which has just collapsed would, we think, be still open to negotiation, even if the Scotch producers did refuse for once to eat the leek.

#### THE LONDON ARBITRATION CHAMBER.

It must be very satisfactory to the originators of the London Chamber of Arbitration to find that the Chamber has done such good work during the past three years. There is not the slightest doubt, we think, that the object with which it was instituted has been, as a whole, satisfactorily achieved. It is true that it has not met with as full support as might reasonably have been expected, but it has, nevertheless, been sufficiently appreciated to prove that it was wanted.

In a large measure it has been handicapped by the new Commercial Court, which was practically the outcome of the competition between the Chamber and the law courts. We had occasion recently to refer to the progress which the Commercial Court was making, but we are of opinion that there are still many advantages in connection with the use of the Chamber of Arbitration in industrial disputes.

It appears that the average time occupied in the disposal of the cases which have been heard in the Chamber has been ten days, reckoning from the lodging of the submission to the award. No doubt the new Commercial Court could do as much in the way of economising time, but we think that the majority of litigants will think with us that in the matter of cost the Chamber of Arbitration has the pull, for the amount of the fees in each case has, on the average, not exceeded five guineas. At the same time there can be no question as to the efficiency of the Chamber as a means of arbitration, although its working expenses are as low as the average fees above mentioned. In 1892 the Court of Common Council granted £600. to meet expenses, and up to the present time the total expenditure has been just under £500. It is not often in law matters that anything connected with expenses turns out lower than the expectation.

**THE SECRETARYSHIP OF THE IMPERIAL CONTINENTAL GAS ASSOCIATION.**—Mr. G. F. Thompson has been compelled, on account of the state of his health, to resign his appointment as secretary of the Imperial Continental Gas Association, and to retire from the service. He is succeeded by Mr. R. W. Wilson, the assistant-secretary. Mr. Thompson, it may be remembered, undertook the secretarial duties at the commencement of last year, upon the resignation of Mr. R. S. Gardiner.

**REPORTED COMBINATION OF COAL PRODUCERS.**—According to a report in circulation early last week, a combination has been formed among East of Scotland and Lothian producers of cannel gas-producing coal, to raise the price. The charge for best cannel coal has declined to below 20s. per ton; whereas three years ago the quotation was 35s. It appears that producers have large stocks on hand, and the present time is regarded as favourable for forming a combination. It is understood that the Muirkirk gas-coal fields will be included in the combination.

## LOW TEMPERATURE RESEARCHES.

BY H. GRIME.

(Continued from page 4.)

### COLOUR OF PIGMENTS AT LOW TEMPERATURES.

AS we have said, most gases when liquefied are colourless. It is interesting to note the effect of reduction of temperature on bodies which are usually spoken of as coloured. Houston and Elihu Thomson (1871 Jour. Frank. Inst., quoted in Chem. News) have stated that as the temperature rises the colour of bodies tends to pass from one of a greater to one of a less number of vibrations. As Nicholls and Snow put it (Phil. Mag. 32, 1891, p. 407), the effect of heating a pigment is to diminish its reflecting power, the diminution being as a rule more marked in regions of great refrangibility. Hence comes the shifting of the colour towards the red. Ackroyd (see Chem. News, vol. 34, p. 76) concluded from theoretical considerations that as absolute zero is approached the prevailing tints of pigments will be blues and violets, finally merging into white. Experimental evidence seems in the main to support these theoretical conclusions. Prof. Wiedemann has stated, and his statement is confirmed by Dewar, that in contact with solid carbon dioxide, that is, at a temperature of about  $-80^{\circ}$ , sulphur is not yellow, but white. Prof. Kreutz in 1891 showed that vermilion, mercuric iodide and iodine become brighter at low temperatures. I suppose the increased brightness must be considered as due to a larger proportion of white light, and therefore of blue and violet rays in the reflected light. Professor Dewar has shown that at the temperature of boiling oxygen, vermilion is pale-orange and sulphur, potassium chromate, ferric chloride, and iodine tincture have lost their colour. The colours reappear as the temperature is allowed to rise. Blues and organic colours generally are said to be indifferent to change of temperature.

Returning to the action of liquid oxygen upon light it may be noted that no anomalous dispersion of light has been observed. Its index of refraction has been determined both by means of the prism and by the method of total reflection. The difficulty of obtaining prisms to withstand the great cold made the latter method preferable. The values obtained by Liveing and Dewar were 1.2236 by the prism method, and the higher value of 1.226 by the method of total reflection. Using the latter method Olszewski found the value 1.2235, but subsequently in conjunction with Witkowski he obtained the lower value 1.2226. By the total reflection method Liveing and Dewar also determined the refractive indices of nitrogen and air. Nitrogen (containing five per cent. of oxygen) gave the result 1.2053, and air 1.2062. These values are for sodium light. It may be noticed in passing that while gaseous nitrogen possesses a higher refractive index than gaseous oxygen, in the liquid state the order is reversed. In both states the refractive index of air is intermediate between those of its constituents. The refractive index of bodies varies with their densities. Several formulae have been put forward as giving a relation between the refractive index and the density, constant for all temperatures and pressures. This constant is known as the constant of refraction. The simplest and, on the whole, the most satisfactory formula yet proposed is that of Gladstone and Dale, who in 1858 showed experimentally that the function  $\frac{\mu-1}{d}$  (where  $\mu$  = refractive index and  $d$  = density) is much

more constant with change of temperature than Newton's expression,

$\frac{\mu^2-1}{d}$ . Gladstone and Dale's formula is not absolutely true. With

some bodies the deviation from the observed values is considerable, and in certain of these cases a closer approximation is obtained by employing the more complex formula proposed by Lorentz, viz.,

$\frac{\mu^2-1}{(\mu^2+2)d}$

Employing the simpler formula, the refractive constant of liquid oxygen, using Liveing and Dewar's value, is .19891; the value previously found for gaseous oxygen was about 5 per cent. lower, viz., .18950. For liquid nitrogen (containing about 5 per cent. of oxygen) the corresponding refraction coefficient is .225. Mascart's value for gaseous nitrogen was about 5% higher, viz., .237. In the search for a connection between the physical properties and the refractive index of bodies it has been found that it is possible, especially in the case of organic compounds, to assign what is called the atomic refractive power to some of the more common elements. This number varies with the relation of the atom to the other atoms in the molecule. Thus, using the Lorentz formula, the refraction equivalent or atomic refractive power of nitrogen is

2.21 for free nitrogen;  
at least 2.27 „ nitrogen combined as in nitrous oxide;  
and 2.50 „ „ „ „ ammonia.

Multiplying by 14 the refractive constant calculated by the same formula for liquid nitrogen, we obtain the number 2.063, which is nearest to the number calculated by Brühl for free nitrogen,

though the agreement is not very close still, allowing for the impurity known to be present in the sample of liquid nitrogen used, it is sufficiently near to lead us to the conclusion that the molecules of liquid nitrogen are not very different in structure from those of the gas.

Another optical effect studied by both Pictet and Dewar is the influence of low temperatures on phosphorescence and fluorescence. Albeit but qualitative and confessedly incomplete, Dewar's results have, like the values of the refractive indices of liquid gases, much interest for the physical chemist. You are all aware that solar spectrum when allowed to fall upon a sheet of paper previously dipped into a solution of sulphate of quinine is considerably extended at the violet end. Bodies which, like quinine sulphate, thus absorb rays of light, and then emit them as rays of different—usually greater—wave length are said to be fluorescent. Fluorescence continues only so long as light falls upon the body, but there are a large number of bodies which, under certain conditions, possess the power of emitting light after the removal of the light stimulus. For instance, calcium sulphide after being exposed to light remains luminous in the dark for several hours. Such bodies are said to be phosphorescent. There seems to be a close connection between fluorescence and phosphorescence; all alkaloids forming fluorescent solutions become phosphorescent at very low temperatures. The degree as well as the duration of phosphorescent luminosity, and the conditions under which it is seen vary greatly with different substances. The phosphorescence of some substances can be seen only after they have been cooled to the lowest known temperatures; other substances require to be raised above the ordinary temperature before they phosphoresce. Pictet has shown that phosphorescent light is entirely extinguished at  $-60^{\circ}$  or  $-70^{\circ}$ , and he concludes that the production of this light requires a certain movement of the constituent particles of bodies. On refrigeration, this movement is annulled, and the phosphorescence disappears. The luminiferous power returns as the temperature rises. (C.R., 1894, Oct.) Dewar has gone further, and has shown that "while the temperature of  $-80^{\circ}$  is sufficient to stop all sensible emission from a previously excited body, it does not prevent an excited body from absorbing light energy that can be evolved at higher temperatures." In his experiments, Dewar cooled the body by dipping it into liquid oxygen, and then exposed it to a beam of electric light. On withdrawal from the lighted chamber into the darkened room, the body was seen to glow with a beautiful bluish or greenish light. An egg treated in this way appeared as a globe of bluish light. Indeed, most substances of animal or vegetable origin are phosphorescent under these conditions. So are the metals, as a rule. But the phosphorescence of metals appears to be due to the existence of an organic film upon their surfaces; for after ignition the metals cease to show phosphorescence. The great activity of organic matter in this respect is seen in the case of water. Impure water is remarkably phosphorescent; pure water is only feebly so. Again, milk is exceedingly luminous. There seems to be some connection between the action of bodies on light at ordinary temperatures and this phosphorescence at low temperatures. Coloured salts and coloured glasses and papers, as a rule, exhibit no phosphorescence. Professor Dewar has also traced some connection between chemical constitution and phosphorescing power, and he has thrown out the suggestion that it may be possible to decide vexed questions of chemical composition or structure by quantitative observations of phosphorescent light at low temperatures.

Amongst organic compounds, the haloid, sulphi- and nitro- derivatives as a rule show nothing of the property, or are, at the most, but feebly luminous. Bodies such as acetophenone (methyl phenyl ketone) and ethyl phenyl ketone containing the ketonic group seem to possess the phosphorescing power in the highest degree. In the case of isomeric substances the position of the various radicles appears to have some influence. The symmetrical dihydroxy-benzene-hydroquinone

is more luminous than the less symmetrical resorcinol

and pyrocatechol  $\begin{array}{c} \text{OH} \\ | \\ \text{C}_6\text{H}_3 \\ | \\ \text{OH} \end{array}$ . Similarly of the triatomic phenols,

the symmetrical phloroglucinol is more highly phosphorescent than pyrogallol. Among inorganic substances as yet tested the platino-cyanides excel all others in the intensity of their phosphorescent light.

On consideration of what has been learnt concerning optical properties it would appear that the effect of matter on the very small waves of the luminiferous ether increases with great reduction of temperature.

We have dwelt so long upon the optical properties that little time remains for the consideration of thermal, and of magnetic and electrical properties.

It has already been stated that liquid oxygen, like the gas, is diathermanous. By means of a globe-shaped vessel containing liquid oxygen the heat rays from an electric lamp can be brought to a focus. A piece of blackened paper placed at that point is set on fire. Thus we learn the remarkable fact that some kinds of matter at temperatures

200 degrees below the freezing point of water present little or no obstruction to the passage of radiant heat. As for the conductive powers of bodies, these seem to increase as the temperature falls. Bodies such as cotton-wool, which, in virtue of their power of "damping" comparatively short heat waves, are known as bad-conductors, have very little influence on the longer heat waves corresponding to temperatures below  $-80^{\circ}$ . Pictet has proved that up to  $-80^{\circ}$  the rate of warming of copper cylinders cooled to  $-170^{\circ}$  is the same, whether the cylinders are naked or covered with a layer of cotton wool 20 inches thick. Above  $-80^{\circ}$  the rate of rise of temperature varies with the thickness of the packing.

By means of his vacuum vessels, Dewar has made a few experiments with a view to determine the law of radiation at low temperatures. So far as they go, the results seem to show that radiation increases approximately as the cube of the absolute temperature. Thus, using liquid oxygen, the amount of gas obtained in a given time was:—

|                                                                  |  |
|------------------------------------------------------------------|--|
| 60 c.c. at $-115^{\circ}$ or $158^{\circ}$ absolute temperature. |  |
| 120 " $-78^{\circ}$ or $195^{\circ}$ "                           |  |
| 300 " $-6^{\circ}$ or $279^{\circ}$ "                            |  |
| 600 " $65^{\circ}$ or $339^{\circ}$ "                            |  |

Another fact brought out by the use of Dewar's vacuum vessels is that the laws of saturated vapours appear to hold at low temperatures.

Turning now to magnetic and electrical properties, we find that, like the gas, liquid oxygen is magnetic. Taking the magnetic moment of iron as 1,000,000, that of gaseous oxygen is 377, and of liquid oxygen 1,000. Liquid air is, as might be expected, feebly magnetic. There is but little evidence upon which to found any general conclusion, but certain substances—for example, ferrous sulphate crystals—seem to become more strongly magnetic as the temperature falls. Experiments by Dewar and Fleming on electric conductivity at low temperatures have confirmed and extended the results of work by Cailletet and Bouty, and by Wroblewski (C.R., 1885, vol. 101, p. 161). They find that the conductivity of metals and alloys increases in a marked degree with reduction of temperature; on the other hand the conductivity of the non-metals decreases. They believe that pure non-metals may possibly reach a maximum specific electrical resistance, and pure metals a minimum specific resistance at or near the absolute zero of temperature. In the case of the pure metals there is a possibility that the resistance may actually vanish at absolute zero. In their early experiments they used wires 50 or 100 centimetres long and three thousandths of an inch (mils.) in diameter. These they coiled round a thin plate of mica, and attached the ends to stout insulated copper rods. This arrangement allowed the resistance coils to be readily immersed in a bath of liquid oxygen. But the wires, rendered brittle by the low temperature, were found to break at the bends, and in the latest experiments the wires were wrapped round cylinders prepared as follows: Two pairs of high conductivity copper rods of 4 m.m. diameter, insulated from each other by india-rubber, were bent round, and a thin sheet of vulcanised fibre was sewn round the ends so as to form a cylinder two to three centimetres in diameter, and four to five centimetres in length. The successive turns of the coil were insulated from each other by means of a silk thread. The observations were taken at seven different temperatures, viz., (1) about  $100^{\circ}$ ; (2)  $20^{\circ}$ ; (3)  $0^{\circ}$ ; (4)  $-80^{\circ}$ , using a bath of ether and carbon dioxide; (5)  $-100^{\circ}$ , in liquid ethylene boiling under atmospheric pressure; (6)  $-181^{\circ}$ , in liquid oxygen boiling under atmospheric pressure; and (7), about  $-197^{\circ}$ , using as a bath oxygen boiling under a pressure of about 25 or 30 m.m. of mercury. It was found that, on plotting out the specific resistances with absolute temperatures as abscissae, the lines of resistance of metals are more or less curved lines, which tend downwards in such a way as to show that if prolonged beyond  $-200^{\circ}$  they would probably pass through or near the origin; that is to say, at the absolute zero of temperature the electrical resistance of pure metals would be probably nil. At the lowest temperature at which observations have been made, copper is the best conductor of all the metals, excelling even silver. As an instance of the great decrease in the electrical resistance at these low temperatures, it may be mentioned that iron at  $-200^{\circ}$  is a better conductor than copper is at the ordinary temperatures. It is worthy of note that the rate of decrease is greatest in the case of the two magnetic metals—iron and nickel. Impurities have a marked effect on the electrical resistance, so much so that Dewar and Fleming believe that the curve of electric resistance over a long range of temperature might be used as a criterion of the purity of a given sample of metal. The resistance curves of alloys are nearly straight lines, with but little slope. When the constituent metals of the alloy are chemically very different, as, for example, in German silver, the slope of the curve is no more than one-tenth that of the curve of a pure metal. In the case of alloys of chemically similar metals as platinum-rhodium the slope is much steeper, but never such as would indicate that, if prolonged, the curve would pass through the origin. The non-metal, carbon, which at the temperature of the electric arc appears to possess practically no resistance, becomes a worse and worse conductor as the temperature falls.

(To be concluded.)

## MERSEY AND IRWELL JOINT COMMITTEE.

THE usual monthly meeting of this Committee was held on Monday, Mr. Alderman Thompson presiding. In the report of the Consulting Sub-committee reference was made to the position of the Bury Corporation. Two months ago the Corporation asked for a further period of two years in which to complete their sewage works. The reason assigned was that it would be impossible to get men and materials to do the work in less time. Subsequently the Corporation intimated that they were perfectly willing to take an extension of the order for twelve months, in order that at the end of that time the Committee might review the progress made, and then either further extend the order or take legal proceedings. They added, "But the Corporation feel that it is unreasonable to grant extension for the period of two months, and accordingly, unless your Committee grant the further extension asked for, there will be no alternative but for the Corporation to apply to the magistrates to extend the order for a reasonable period." The sub-committee now advised that the Corporation "be recommended to apply to the Court for an extension of time, in accordance with the terms set out in the latter part of their letter, and that failing such application being made before the next meeting of the Joint Committee the sub-committee recommend that the matter be then brought to an issue by the Joint Committee making application to the Court for penalties against the Corporation." This course was agreed to on the motion of Mr. T. W. Killick, seconded by Mr. J. P. Haslam. The only other matter of interest before the meeting was the case of Mr. W. Clegg, fellmonger, Milnrow. Mr. Clegg appeared before the Committee, and stated that he had spent between £4,000. and £5,000. on plant for the purification of the effluent from his works, and hoped in a few days to have everything in working order. He proposed to try the scheme recently suggested by Sir Henry Roscoe, which he thought would cost less than the one he had hitherto been working. The Committee gave Mr. Clegg an extension of three months to complete his preparations.

## THE SCOTTISH MINERAL OIL INDUSTRY DURING 1895.

AS an addendum to our summary for the year 1894, published in issue January 26th, 1895, reference was made to the then proposed renewal of the scale and wax agreement with the American importers. The proposal came from the American side, and much foolish writing there was then about the great benefit that was thereby to accrue to the industry as a whole. In that addendum we took the liberty of delivering a word of warning against the roseate inferences that were then being drawn by the daily Press, laying it down as an axiom that for the salvation of the great Scottish industry something very different was required. So long as burning oil remained so badly depressed the business of shale distilling would assuredly continue a precarious, not to say a positively ruinous, one. The new scale and wax agreement was subsequently forged, and quickly found, as we had predicted, to be a very unmanageable benefit indeed. It was shaky from the first, and before the close of 1895 it became little better than a dead letter. The solid paraffins were raised all over by about 1½d. a penny per lb. (no great increase), and the British candle-makers were included in the compact as the main customers for the raw material. The Americans were to give some concessions as regards the continental markets, and they agreed to take up from the Scotch makers a certain quantity of their scale at a price, if not otherwise disposed of. From the first there were suspicions all round of want of fidelity, and underselling was practised in certain quarters. The candle-makers were unable to hold their new association intact, and several members withdrew; the Americans proved to be putting an unexpected reading on the clause regulating the selling of scale and wax on the Continent, and finally, when called upon to take up the surplus of Scotch scale, they refused to do so, alleging that, as the candle-makers' new combination had broken down because of the underselling that had been practised, the American parties to the agreement could not be expected to implement their share of the undertaking. This, in brief, is the history of the new scale and wax agreement during 1895, and as 1896 opens a series of meetings in London are being called, to see whether there is any possibility of the leaky contrivance being tinkered up again. It certainly does not look more promising than it did when we wrote a year ago, but rather less so. Prices of these solid paraffins remain nominally at the agreement range of 1½d. to 2¼d., according to kind and quality, but doubtless, under the circumstances, each individual maker will be holding himself at liberty to sell under that range if he sees fit. But, despite the fatuity of the new scale and wax combine, the year 1895 shone renewed life upon the Scottish mineral oil industry, and that so in the one way we said a year ago it would come, if it was coming at all. Burning oil has advanced in price from the losing figure of 4¼d. per gallon at the beginning of the year, to the highly satisfactory one of

6¼d. The cause of the rise was the partial failure of the American reserves, and a consequent general advance of burning oil values all over the world, including the Russian article as well. At the beginning of the year there was no expectation of anything of the sort, on this side at any rate. The American rise was phenomenal. It began quietly in February, gradually acquired momentum, until in April it went up like a rocket, without even the stick coming down again. It receded from the top elevation, certainly, but held comparatively high for the rest of the year, though slightly easier again just at the close. The effect of it all on the Scottish producers was electrical. They met hurriedly in Glasgow early in April, and raised their oil to 5¼d. for all new prompt sales, at the same time deciding to shut down all their forward selling entirely, no matter what price might be offered. This was done in the nick of the upward rush, and within two or three days there was another highly-excited meeting in Glasgow, at which the Scotch article was put up to 7¼d. per gallon. This proved to be one penny over the just mark, as was shown when the American market righted itself, and declined a little from the top quotations of the boom; and, accordingly, in May, the Scotchmen met again, and adjusted their market to 6¼d. per gallon at works. This figure was maintained pretty steadily, and at it the whole of the contracting for the new season 1895-96 was done. Deliveries at this well-paying price have been going on largely from October, and since that time the industry has been deriving the full benefit of the rise; whereas, before that, the Scotch makers were deriving only a partial benefit from an odd new sale now and again. Only after the balancing in the spring of 1896 will it be possible to gauge accurately the amount of the good accruing; but it may be said that the advance of 2d. per gallon (if fully maintained) on so very extensive an output as that of burning oil will mean to these Scotch companies quite a potential increase of yearly revenue—much more than sufficient to restore to vigour those of them that had not been weakened down past all hope of survival. Everything depends on the American production—if it should become over-abundant as before, then the general price will lower again as a consequence.

With the exception of sulphate of ammonia, the other products of the industry have done fairly well. Paraffin spirit began the year at 6d. per gallon; dropped to 4½d., took to the rise again till 9d. was touched, and is now steady at 8d. Lubricating oils at the beginning were at a range of £4. 5s. to £6. for 865°/895°, and have gradually mended to £4. 15s. to £6. 10s. The improved movement in these two articles is due to the general revival of trade. Sulphate of ammonia has done very badly, partly owing to the over-production of it and of rival fertilizers, and partly, apparently, because of its being, for the time, less in favour with agriculturists. At the close of 1894 it was fetching over £11.—a considerable decline from the top value of that year—but still fairly remunerative. It has dropped all 1895, and before the close had been done at £8. 8s. 9d., though now fractionally better. At present it is by far the most disappointing of the products, though, owing to the serious hitches above referred to, the solid paraffins also give no little cause for anxiety.

At the spring balancing only two of the companies paid anything—the Broxburn and the Pumpherston—but on the whole, bookkeeping charges were better met. Sulphate of ammonia had been fairly remunerative over the period operated on. The new Clippens Company struck balance at the end of September, coming out with a loss of £2,883. for the year, making a total of £13,555. over the three years of their struggle. The Dalmeny balanced at the end of October, finding once more a 20 per cent. dividend for the shareholders. This company is lightly burdened with capital; its crude oil was all well contracted for, and its sulphate bore fair prices for the first half of the year. Production being confined to these two, the Dalmeny is not liable to the vicissitudes of the larger refining concerns. Following the burning oil boom, the shale miners moved for a rise of wages, and the men of the Caledonian Company came out; but the masters were firm, and the men had to content themselves in the meantime. On the Stock Exchanges oil shares went up wildly early in the year, but adjusted themselves afterwards. At present they suffer from the rupture of the American agreement. The officers of the Society of Chemical Industry have been keeping an eye to the flash-point movement, and some public notice has been paid to it; but the companies have been holding aloof in terms of agreement with the Americans. On the whole, 1896 opens with better hopes than have prevailed for a long time; but there is no certainty, and much of the future depends on influences which are altogether outside the guidance of the native industry itself.

**NITRATE STATISTICS.**—The Permanent Nitrate Committee's public statistical circular for January shows that the total exports to Europe during December were 2,362,000 quintals; loading for Europe, 1st January, 1,000,000 quintals; imports (Europe), December, 57,610 tons; deliveries in Europe, December, 45,720 tons; visible supply (Europe), 1st January, stocks and afloat, 664,180 tons.

## SOCIETY OF CHEMICAL INDUSTRY.

## MANCHESTER SECTION.

THERE was a large muster of the members of the Manchester section of the Society of Chemical Industry at the third meeting of the session, held last week, at the rooms of the Chemical Club, Victoria Hotel. The title of the first of the two papers, that by Dr. B. W. Gerland, had been misprinted on the agenda card. Instead of "Some new Methods of Testing Gas," the title should have been "Some new Methods of Testing Indigo"—a blunder which the Chairman (Mr. G. E. Davis) laughingly attributed to the festivities of the season.—Dr. Gerland, in his paper, stated that there innumerable methods of testing indigo, but none were absolutely reliable—a circumstance which was all the more surprising in view of the value of indigo as an article of commerce. He referred to some of the new methods, and it appeared that he himself favoured the nitro-benzol process, which differs very much from the ordinary methods. In the course of the discussion which followed much diversity of opinion was manifested.—Mr. Rawson, of Bradford, who is recognised as one of the leading authorities in the country on indigo testing, laid great stress upon the fact that "indigotin" could be most accurately estimated by means of permanganate of potash, and that the method applied to commercial indigo after removal of other substances capable of acting upon potassium permanganate formed at present, in his opinion, the best method of analysis. He had heard, he said, of experiments with the nitro-benzol process, in which it was found that the high temperature destroyed some of the indigotin.—The Chairman also favoured the use of permanganate of potash, the action of which, he said, was constant and reliable.—Dr. Gerland admitted that it was so when the indigo was pure.—Mr. Wilfrid Irwin followed with a paper relating to gas manufacture. At the closing meeting of last session he read an interesting paper on the enrichment of gas, a subject which is at present receiving much attention from gas companies and corporations owning gasworks, as it is found that by the use of oil, benzol, and other enrichers it is possible to dispense to some extent with the use of high-priced cannel coal. He was invited to continue his researches, and at this meeting he discussed "The effect of heat on the illuminating power of coal gas, and its relation to the theory of flame." He described some of the phenomena of flame, referring in particular to the stratification observable in an ordinary gas flame, a point as to which, he remarked, we did not yet know all that was to be known. In certain experiments he had made he had found that on subjecting coal gas to a high temperature there was a great reduction in the illuminating power. Luminosity he found to be due to two different sets of reactions, and he pointed out that while one burner was more favourable to one set another might be more favourable to another set. The results he had obtained seemed to show that the argand burner, which was used for testing in most gasworks, was scarcely a fair method of estimating the commercial value of gas, and he suggested that a fairer method would be to take the average of the union jet and the slit burners, which were those in everyday use.—The discussion of Mr. Irwin's paper was postponed.

## NITRATE, INDIGO, AND TALLOW IN 1895.

**Sodium Nitrate.**—In the early part of the year the nitrate market was acutely influenced by severe wintry weather, which prevailed into March, and rendered the agricultural season one of the latest on record. Owing to the closing of many rivers and harbours, the delivery of nitrate in January and February was rendered almost impossible, whilst farmers were, of course, wholly unable to make use of the article. The value of arrived cargoes in the beginning of January was 8s. 10½d. per cwt., but, because of a shrinkage of the demand, caused by the protracted winter and indisposition on the part of the trade to buy at so full a price, values gradually fell away, until 7s. 9d. per cwt. was reached in April. The lower range of prices stimulated the demand very materially, and the deficiency of deliveries in January and February was more than made good in the two following months. Under the influence of rumours favourable to the completion of a combination scheme to restrict production, a large business was also done in summer shipment at about 8s. 3d. per cwt., and in autumn shipment at 8s. 4½d. to 8s. 7½d. per cwt. In the month of October shipments increased. The result was an irresistible declension in values until several arrived cargoes changed hands at 7s. 6d. per cwt., two exceptionally low transactions taking place at 7s. 5d. and 7s. 4½d. per cwt. This was the low water mark for cargoes, although in Continental centres speculative dealings took place even below this parity. During December there was a distinct improvement, probably resulting from the fact that shipments for this month proved to be more moderate than was at one time expected. Arrived and due cargoes were at the close held for 7s. 7½d., and October-December sailings for 7s. 8d. to 7s. 11d. per cwt., as in

size and position. The consumption for the year amounts to 907,000 tons, of which the Continent took 789,500 tons, and the United Kingdom 117,500 tons. This represents an increase of 5¼ per cent. on the Continent and of 2½ per cent. in the United Kingdom as compared with 1894.

**Indigo.**—At the close of the year prices were somewhat lower than those ruling at the opening, whilst, except during very short intervals, there was but little animation observable either at the public auctions or in the private market. The causes are, however, very apparent. In the first place, owing to the lateness of the arrivals of new crop, the January sale took place at a time when the market was still very bare, and prices consequently showed an advance which was hardly justified looking at the general position of the article and the very low rates that had been ruling in Calcutta, whilst in the second place, as the year advanced, the market was very much influenced by the prospects of another large Bengal crop. The fluctuations in value have, however, not been very important. The advance in January was quite lost at the April sale, and the slight recovery in July again disappeared in October, the final result being that prices at the last October auctions established an average fall of about 2d. to 3d. per lb. compared with those ruling 12 months previously, but taking the values on the 31st of December there is very little change.

**Tallow.**—To those who relied on the scarcity in America and the promised short supplies from Australia for an advance in prices the result has been disappointing. Advances repeatedly came to hand from Australia that, owing to the persistence of drought, a considerable decrease in the shipments would ensue, but month after month large shipments took place, with the result that the arrivals here far exceeded those of any previous year. The stock in London has more than doubled during the year, and is now larger than it has been for 30 years. Home tallow has not been very plentiful at any time, and soap-makers here have freely availed themselves of the plentiful supplies from the colonies. Exporters have found, especially during the latter part of the year, considerable difficulty in selling in Holland and Germany, owing to the competition arising from the abundant supply of inland tallow there. The fluctuations of prices at the auctions were unusually small. The extreme limits of fine mutton tallow were 25s. 6d. and 23s. 6d. Prices of beef tallow had a wider range. Beginning at 22s. 6d., on July 19th 20s. 6d. was touched; from that date there was a steady advance until October 11th, when 24s. 3d. was paid, the highest of the year, and an uninterrupted decline has since taken place to 21s. 6d., the closing figure.

## DRYSALTERY SALES IN 1896.

DURING this year the following sales of interest to the trade will be held. Most of them are held at the London Commercial Salerooms, excepting those for drugs, which take place at the New Corn Exchange Hotel, Mark Lane; the tallow and oil sales are held at the Baltic, and those of indiarubber, and a few other articles, at one or other of the Brokers' Showrooms.

**SHELLAC AND DRYSALTERIES.**—Every Tuesday, at 1 p.m. The first sale was held last Tuesday, 7th inst.

**GUMS.**—*Arabic*, &c., on Thursdays, at 12-30 p.m., once every four weeks. *Varnish*, &c., gums, every four weeks, on Thursdays, at 12 noon.

**INDIARUBBER.**—Every Friday, at 12 noon. The first sale took place yesterday, 10th inst.

**EAST INDIA INDIGO.**—Commence on January 27th, April 13th, July 13th, October 12th.

**GUATEMALA INDIGO.**—These sales are held in March, July, October, and December, the dates being regulated by the conclusion of the East India indigo sales.

**ISINGLASS.**—Sales will be held at 12 noon on February 18th, March 17th, April 21st, May 19th, June 16th, July 14th, August 25th, September 22nd, and October 20th. The first sale of the year was held last Tuesday.

**HORNS, BONES, &c.**—Sales are held on two consecutive days, at 11 a.m., deer horns and bones being sold on the first day, and buffalo, ox, and cow horns on the second. The dates are:—February 19th and 20th, May 14th and 15th, August 6th and 7th, November 12th and 13th.

**TALLOW AND OILS.**—Every Friday, at 12 noon, in the Baltic Salerooms, South Sea House.

**BLACK SMOKE FINES.**—At the recent meeting of the Manchester justices, Mr. James Johnson moved the following resolution: "That the Clerk be instructed to compile a return, for distribution to the justices, showing—(a) The number of informations heard during 1895 for offenders emitting black smoke, and the way in which the cases were dealt with; (b) the duties and powers of justices with regard to these prosecutions." Mr. Johnson declared that for people who were old offenders the fines were inadequate.

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

- Removing Mineral Oil Stains from Vegetable Fabrics. J. Y. Johnson. 24,653. December 23.  
 Apparatus for Manufacturing Acetylene Gas. T. Holliday and J. H. Esley. 24,666. December 24.  
 Improvement in Galvanising. R. Heathfield and W. S. Rawson. 24,703. December 24.  
 Separating Lubricating Oil from Condensed Water. H. H. Lake. 24,708. December 24.  
 Purification of Oils and Fatty Substances. A. E. Morgans. 24,714. December 24.  
 Improved Treatment of Spent Oxide. J. H. Paul. 24,733. December 27.  
 Degreasing Wool and Recovering Oils, etc., from Fibrous Materials. G. E. Wright and W. Monk. 24,787. December 27.  
 Improved Method and Apparatus for Washing Alkali-amalgam obtained by Electrolysis. P. Jensen. 24,837. December 27.  
 Improved Preparation of Compounds of Fluoride of Antimony. H. H. Lake. 24,848. December 27.  
 Treating Nitrogenous Organic Matters for Production of Ammonia and Residual Products. A. McDougall. 24,920. December 30.  
 Sewage Filtering Apparatus. T. B. Jones. 24,943. December 30.  
 Apparatus for Destroying Obnoxious Fumes, and Recovering Bye-products from Distillation. S. G. Merrick and H. L. Washburn. 25,001. Dec. 31.  
 Improvements in Electrolytical Apparatus. R. Heathfield and W. S. Rawson. 25,052. December 31.  
 Improved Process of Making Oxide of Lead. H. H. Lake. 25,069. December 31.  
 Improved Sewage Filters. M. Hilton. 25,021. December 31.  
 Purifying Red Oxide of Iron. G. H. Smith. 25,023. December 31.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal and ALL RIGHTS of publication are RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

**An Improved Method or Process and Apparatus for Obtaining Chlorine and Zinc in the Treatment of Ores Containing Zinc or Blende and other Metals and Metalloids.** H. R. Lewis, 7, Drapers' Gardens London, and C. Gelstharpe, 211, Jubilee-terrace, Clayton, Manchester. Eng. Pat. 524. Jan. 9, 1895.

The ores are first crushed and then calcined so as to render the zinc contents soluble in water or a mixture of water and acid, with or without a chloride. The calcination is effected in the furnace detailed in specification 6,567/92, wherein the method of recovering the sulphurous gases given off is described. After being properly calcined, the ores are lixiviated with water or acid water, and the solution thus obtained passed when necessary over fresh oxidized ores. A suitable chloride, such as salt, etc., is now added in proportion to the amount of zinc in solution, the whole concentrated to a desirable strength, and then allowed to stand so that the sulphates may separate. The solution thus obtained is subjected to electrolysis.

When any soluble chloride, such as calcium chloride, that forms insoluble sulphates is added, the latter are allowed to separate prior to the evaporation. The precipitated metals forming the residue are recovered in accordance with specification 8,467/92. The electrolysis is conducted in a specially-constructed apparatus, two forms of which are illustrated. The distinguishing features in each instance are: (1) The introduction of deflecting plates between the electrodes, which direct the evolved chlorine gas upwards; (2) an arrangement of scrapers which periodically remove the crust of deposited zinc; and (3) the provision of means whereby the contents of the cell can be heated. In one case this is accomplished by steam pipes, and in the other by a hot steam, air, or water jacket. The process is, of course, applicable to the direct treatment of zinc solutions. This patent avoids the use of lime, and diaphragms in the electrolytic vats, so that currents of lower voltage can be employed.

**Improvements in and Relating to Tanks for the Precipitation of Sewage and Foul Waters.** G. H. Skelsey, 15, Cook-street, Liverpool. Eng. Pat. 2,449. Feb. 4, 1895.

The object is to effect the deposition of the precipitated impurities more simply, and to perform the removal of the collected sludge automatically. The tank is formed with baffle walls alternately sprung from the bottom, and carried by a girder from the top. In this way the sewage flows first down and then up until it reaches the end of the tank. To avoid the formation of currents the sewage runs into the main tank by overflowing the sill of a trough that extends the full width of the tank. The bottom of each division of the tank is contracted like an inverted bottle neck, in the narrow portion of which the sludge collects and remains in a state of comparative quiescence, finally settling under

arched tiles which enclose the lowest portion of the bottle-necked channel. From time to time, by opening a cock on a sludge outlet pipe connected with this channel, the sludge is forced out by the weight of the superincumbent water in the tank.

**Improvements in and Relating to Apparatus Employed in the Recovery of Precious Metals from their Solutions.** H. L. Sulman 60, Gracechurch street, London. Eng. Pat. 2,729. Feb. 7, 1895.

The apparatus is designed to supply regulated quantities of a precipitating agent to a measured quantity of the solution to be treated. Thus, while a ball tank fitted with a syphon is filling with gold solution, a specially constructed valve passes a definite quantity of zinc fume suspended in water in a second tank into the outlet pipe connected to both tanks. As the gold solution tank fills the ball cock rises, and, by means of a sector lever, actuated by a chain connected to the ball cock rod, causes the displacement of a definite quantity of zinc liquor from the zinc tank. When the former tank is full the syphon (which is bent into the form of a "pigtail twist") operates, discharging the contents as well as the zinc charge into a conical mixing vessel. Owing to the tangential entrance of the solution into this vessel a thorough mixing is attained, the contents finally passing by a second similarly constructed syphon to the precipitation tank. As it enters one end of the latter, which is partitioned off from the main portion of the tank, the mixture of gold solution and zinc fume is kept mixed by descending over inclined baffle plates to the bottom, where it passes under the partition and rises through zigzag plates placed in series, close together. On these the gold and zinc deposit, and slide down to the bottom of the tank, which is fitted with mud holes. The liquid portion overflowing into a surrounding exterior vessel, filters through a false cloth bottom, and passes away to a sump, to be used over again.

**Improvements in and Relating to Apparatus for Drying Superphosphates and other Granular Materials.** C. Zimmermann Harburg, O. Ruperti, A. Borgnis, C. von Merck, and E. Merck, trading as H. J. Merck and Co., 6, Davenhof, Brandstwick, Hamburg. Eng. Pat. 4,429. March 1, 1895.

A chimney-shaped chamber heated by flue gases is filled with shaking plates suspended by chains, so as to incline first to one side and then to the other. The material is fed in at the top by a conveyor. The plates are shaken by rods attached to the under side, and set in motion outside by belt pulleys and eccentrics. The angle of inclination can be regulated from the outside during the operation of drying by lengthening or shortening the chains which are attached to ratchet wheels and pawls. A characteristic feature is the lateral disposition of the coke furnace, which permits the convenient removal of the dried superphosphate as it falls from the last shaking plate, and also gives additional control over the heating gases in their passage to the drying chamber. There are three drawings.

**Improvements in Apparatus for the Recovery and Purification of Waste Oil.** V. Camiz Via, 2nd Aprile No. 5,019, Venice, and A. Bettoni, Ponte San Soverno, No. 4,932, Venice. Eng. Pat. 11,048. June 19, 1895.

This invention is essentially mechanical. Three drawings show the general arrangement of the apparatus employed. It is designed to deal with the waste oil mixed with condensed water from all classes of machinery on land and aboard ship. The separator, which is the main feature, is kept at 140° F. by a steam pipe, and is in connection with a series of special filters.

**Improvements in the Manufacture of Lead Pigments or Lead Compounds for Use as Pigmentary Materials.** W. B. Priest, 50, Fenchurch-street, London. Eng. Pat. 17,145. Sept. 8, 1894.

A mixture of sulphate of lead and water is heated to within 10° of the boiling point, and then a magma of calcium hydroxide added. The whole is boiled until the reaction is complete.

The calcium sulphate is separated from the hydrated oxide of lead by diluting with water and well agitating; on settling two layers are formed, with the hydrate at the bottom. Mixed with sulphate of lead, several pigments can be prepared in the manner described in the specification. To make white lead, containing some sulphate, the above process is followed, up to the completion of the reaction between the lead sulphate and calcium hydroxide, when CO<sub>2</sub> is blown in. If desirable, the latter may be passed over the lead hydroxide after drying.

**Improvements in or Relating to the Precipitation of Precious Metals from their Solutions.** H. L. Sulman, 60, Gracechurch-street, London. Eng. Pat. 2,730. Feb. 7, 1895.

In using zinc fume to precipitate gold from cyanide solutions the presence of oxide of zinc is not desirable. This patent provides for the purification of the fume by treating with either ammonium hydroxide, chloride or carbonate, by which reagents the oxide is removed, leaving the metallic zinc. The same method can be applied to the cleansing of the zinc shavings used in the precipitation boxes in the ordinary cyanide

process, thus obviating the necessity of using quite fresh shavings or turnings.

**Improvements in the Recovery of Ammonia from Sewage Effluents and other Weak Ammoniacal Liquors.** T Twynham, Elmhurst, Egham, Surrey and F. E. Matthews, The Pines, Englefield Green, Surrey. Eng. Pat. 2,625. Feb. 6, 1895.

The ammonia is obtained by passing the weak solution over hydrated oxide of iron in combination with phosphoric acid. In practice the material is supplied in a natural form by hydrated iron ores rich in phosphoric acid. The filter, packed with this material, is surrounded with a jacket which can be heated by steam, &c., and so drive off the absorbed ammonia. For sewage the bottoms of the usual filters are packed with the ammonia-absorbing ore, the upper portion removing the suspended matters, and leaving the iron ore to act on the effluent. When the absorbing power of the iron ore is exhausted it can be used direct as a fertilizer, being valuable for its ammonia and phosphoric acid, or the former can be removed with weak acid.

## REVIEW OF THE MANURE TRADE IN 1895.

A review of the past twelve months shows an almost continual decline in the value of manure material, both nitrogenous and phosphatic. The spring manure season was a disappointing one, leaving extensive stocks of manures, as well as material, in the hands of the manufacturers. In the main, the policy of manure makers has been to buy from hand-to-mouth, so that in order to effect sales, sellers of material have had to make heavy concessions in price, until the level reached is lower than any previous record.

**Mineral Phosphates.**—With uninterrupted working of the South Carolina deposits and increased Algerian output from Algeria, quotations have had to give way. The value of South Carolina and similar grade Algerian at the beginning of the year was 6½d, the closing value is about 5½d. The opening quotation for Peace River was 6¾d, but now 6d. is the outside value. In January 7¾d. was asked for 75/80% Florida Rock, but 7½d. had to be taken in order to effect sales. During the spring months the principal raisers combined to maintain prices, but in June the combination came to an end, when the price immediately became 6½d., and then 6¼d., which latter price was about the value of cargoes at the close of the year. The low price reached must be altogether unremunerative to raisers, and a recovery in value would seem to be inevitable.

**River Plate Bones.**—With ample supplies of cheap mineral phosphates and cheap nitrate of soda, and still cheaper sulphate of ammonia, the value of bone in all shapes has fallen continuously. The high prices throughout 1894 induced much larger shipment of bone, especially from India, and the available supply for 1895 spring manure season proved to be more than sufficient. The value in January was £4. 10s., but in March it had fallen to £4. 2s. 6d., and that remained the price until June, when £4. 5s. was paid. Since then the value has declined, until at the close of the year £3. 16s. 3d. was the outside value.

**Crushed India Bones and Bone Meal** have in the main been in line with River Plate bones. The opening value in January being about £4. 12s. 6d. and the closing value in December about £3. 17s. 6d. per ton, although £4. asked for crushed Kurrachee bones.

**Nitrate of Soda.**—Owing to the late opening of the season allowing the heavy shipments of the later months of 1894 to come on the market in time to meet the heavy spring demand, prices at no time rallied much beyond the January opening value. Sellers remained very firm until the second half of March, when it became evident that supplies would be more than sufficient. The price then drooped to 8s. 1½d. to 8s. 4½d. in April, and to 7s. 10½d. to 8s. in May. In August, 8s. 1½d. to 8s. 3d. was current value; in September, 7s. 9d. to 8s.; and in October, 7s. 7½d. to 7s. 9d., since when there has been no quotable change. Due cargoes at the close of the year were worth about 7s. 7½d. per cwt. From time to time efforts have been made to reconstitute the combination of producers, but so far all efforts have proved abortive. At the close of the year negotiations were still pending with decidedly better prospects of success than hitherto, but should the combination be effected it is not likely to affect prices very substantially over the coming spring season, owing to the very large visible supply. The visible supply (stock and afloat) at the end of the last three years has been as follows:—1893, 445,000 tons; 1894, 500,000 tons; 1895, about 660,000 tons. Deliveries:—January/April, 1894, were 500,000 tons; January/April, 1895, 505,000 tons. No doubt the low price reached will stimulate consumption, but after making ample allowance for that, there cannot fail to be a very considerable surplus to carry forward to next season.

In **Miscellaneous Nitrogenous Material** business has been comparatively small, but prices have in the main been governed by the value of ammonia in sulphate of ammonia and bone.

## JAVA INDIGO IN 1895.

IN their review of the Java indigo trade during the past year, Messrs. Bunge & Co., of Rotterdam, state:—The prices of Java indigo have not fluctuated much during the past year. Business was not very animated, but during the last month a better feeling prevailed on account of the rise at Calcutta, which placed Javas in a much better position, and several dealers and consumers were again in the market.

Round lots have been sold, and further inquiry is looked for. The three good qualities of Java indigo, viz., strong colour, tender paste, and high test, are always much appreciated, principally when prices are on a par with other sorts. The reports of the new crop are favourable, and at about the end of February the first arrivals are expected in Rotterdam. The comparative prices for 1894-5 were as under:—

|                    | January, 1895. |    |         | January, 1894. |    |         |

## EXPORTS OF ALKALI AND BLEACH.

THE following figures, which are taken from the official foreign and colonial statistics of the United Kingdom, give the amount and value of alkali and bleaching materials shipped to the undermentioned countries during the month of November, 1895, as compared with the same month in 1894:—

| ALKALI.                  |         |         |         |         |
|--------------------------|---------|---------|---------|---------|

## Trade Notes.

MESSRS. BRYCE AND RUMPF. —We are advised that from January 1st this firm has ceased its connection with the Farbenfabriken *von* F. Bayer and Co. They will carry on business as heretofore in chemicals, dyewares, &c., at 58, Fountain-street, Manchester, as their headquarters.

**CHEMICAL EXPORT TRADE IN 1895.**—The feature of last year's trade which gives most satisfaction is the distribution of the increase in the value of the exports throughout so many industries. Cotton, coal, and chemicals alone have failed to participate, and the decline in these very important staples is the *amari aliquid* of the Board of Trade returns. The coal shipments show a modest increment in tonnage, but a decline of £1,928,630 in the value, which is due to comparison being made with a year in which prices had been raised by the 1893 strike. The falling off in chemicals is practically confined to manures, but alkali and bleaching materials have declined in value, though the quantities shipped were larger.

**DESTRUCTIVE FIRE AT LITTLEBOROUGH.**—About half-past two o'clock last Monday, two police officers, while on duty at Littleborough, discovered that the oil manufactory at Cleggswood, near Littleborough, belonging to Mr. James Butterworth was on fire. They raised an alarm, and the Littleborough Fire Brigade were soon at the scene. The building was one storey in height, fifty yards in length, and thirty yards in breadth. The fire is supposed to have originated in a large quantity of pressed manure, which was stored in one corner of the building. There was a large quantity of oil in another part of the premises. Owing to the inflammable condition of the property, the building was soon destroyed. The damage is estimated at £2,000. The property was not insured. On Sunday evening Mr. Butterworth noticed the manure smouldering, and his son threw water upon it.

**TANNING MATERIALS IN 1895.**—The year opened with a moderate demand for ground Adelaide Mimosa bark at £9. 15s. to £10., and good Portland £1. cheaper; these prices stiffened about midsummer to the extent of 10s. a ton, but, larger quantities arriving, the advance has been lost, and quotations are rather lower at the finish of the year than at the commencement. Gambier kept a steady course until the end of April, when the general excitement in the leather market caused a sudden leap of £4. to £5 a ton for spot and 30s. for arrival; the extravagant quotations for spot soon began to yield, and in July 21s. was taken for spot and 20s. for arrival; since then the market has been weak, present values being—for spot, 19s. 6d., and arrival, 18s. 6d. Valonia: £12. to £13. 10s. may be quoted as the opening prices of the year for fair to good Smyrna; about midsummer, the reports of the new crop being favourable and tanners well supplied, no disposition was evinced to operate at importers' quotations; hence very little business has been transacted during the later months of the year. Holders are showing a desire to meet buyers, and some good samples are now offering at £12. to £12. 10s., and fair quality £11. to £11. 10s.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

The position of tar products in general is steady, makers being well sold. Benzols are firm at 2s. 3d. for 90's and 2s. for 50/90's. There is no alteration in carbolic acids, which are steady at 1s. 9½d. for 60% crude, and 6½d. for 40% crystals. Solvent naphtha remains at 1s. 6d. and crude 10d. Creosote and anthracene unaltered. Pitch keeps stationary at 37s., f.o.b., East Coast.

Sulphate of ammonia is steadier, and the position of forward is rather better when considered in relation with spot values. Beekton still stands at £9., London outside makes £8. 12s. 6d., Liverpool £8. 12s. 6d., Hull £8. 11s. 3d., and Leith £8. 10s. Forward offering at £8. 15s., February-March, and £8. 17s. 6d. for March-April delivery. Nitrate of soda quiet.

### THE METAL MARKETS.

**LONDON, WEDNESDAY.**—Pig iron, firm: Scotch warrants closed at 44s. 11d.; Middlesbrough, 36s. 2½d. cash, and hematite, 45s. 11d. Copper, firm: Chili bars, G. O. B.'s and G. M. B.'s closed at £41. 6s. 3d. to £41. 11s. 3d. cash, and £41. 13s. 9d. to £41. 18s. 9d. three months. Tin, firmer: Straits closed at £59. 5s. to £59. 15s. cash, and £59. 17s. 6d. to £60. 7s. 6d. three months. Australian, £60.; English ingots, £62. 10s. to £63. Lead, easy: Spanish, £11. 5s.; English, £11. 7s. 6d. to £11. 10s.; Silesian spelter, ordinary, £14. 10s. to £14. 11s. 3d. Nickel, 1s. 1½d. Antimony, £30. 5s. Quicksilver: first hands, £7. 7s. 6d.; second hands, £7. 6s. Copper shares, steady: Cape, 1½ to 2½; Copiapo, 1¾ to 2; Libiola, 2¾ to 2¾; Mason and Barry, 2½ to 2¾; Rio Tinto, 14¾ to 14¾; Tharsis, 4½ to 4¾.

**GLASGOW, WEDNESDAY.**—Market steady, with moderate business. Scotch done at 44s. 11½d., 45s., and 44s. 11½d. cash, also at 45s. 2d., 45s. 2½d., and 45s. 1½d. one month; closing with buyers at 44s. 11½d. cash, sellers ask 45s. Cleveland done at 36s. 4½d. one month; closing with buyers at 36s. 2½d. cash, sellers ask 36s. 3d. Cumberland hematite done at 45s. 11d. cash; closing with buyers at 45s. 11d. cash, sellers ask 46s. Middlesbrough hematite closes with buyers at 44s. cash, sellers ask 44s. 2d.

### LIVERPOOL MINERAL MARKET.

There is little alteration in our market to report this week, as it has ruled generally steady. Manganese arrivals have continued to somewhat improve, but they have gone into consumption, whilst stocks have been drawn upon, and prices have therefore continued firm, with an upward tendency. Ground manganese continues to meet with a good demand at £6., £8., £10., and £12. 10s. per ton, according to quality. Manganiferous iron ore is unaltered at last quotations, 16s. to 17s. 6d. per ton, c.i.f. Chrome ore: Arrivals have somewhat increased, but are going into direct consumption against contracts; what little is in stock has been drawn upon, and prices continue unchanged at the last quotations—70s. to 100s. and 105s. per ton, according to grade. Bauxite is in good demand at 20s. per ton for first, 16s. for second, and 12s. for third quality, f.o.b., in cargoes. French chalk: The arrivals continue steady, but sales have increased on account of the reopening of the mills, and therefore prices continue firm, especially for "Angel White" brands, which are in good request, at 70s. to 75s., 80s. to 90s., and 100s. to 110s. per ton, according to grade. Wolfram and scheelite continue firm; stocks are now practically nil. Arsenic is firm at full prices. Fuller's earth: "Emerald" and other brands are steady at 50s. for lump, 55s. for ground, and 70s. per ton for impalpable powder. Rottenstone is scarcer and bringing full figures—£8. 10s. to £15. per ton, according to quality. Ochres and umbers are unchanged, French J.C. ochre being done at 85s. per ton, and primeumber at 40s. to 45s. per ton. Oxides of iron are selling freely at £6 to £10. per ton for good staining qualities, and prime grades at from £18. to £20. per ton. Carbonate of barytes is unchanged, with an upward tendency. Sulphate of barytes is without change; prime quality is scarce, and brings full prices. Fluor and feldspars are unaltered, and the demand continues steady at full figures. Emery stone: There are practically no stocks, and sales to arrive have been made at full figures. Mica: The demand is steady at £15., £18. and £25. per ton for prime ground qualities. Bog ore is in moderate demand at 22s. 6d. per ton. Plumbago: The demand for founders' and lubricating qualities continues unchanged at £6. to £10. per ton, prime powdered Ceylon qualities being done at £15. to £20. per ton. Pumice stone: Lump is steady; there is a better demand for the powdered at £7. to £10. per ton. Iron ore is still quiet at about 10s. per ton; Spanish and other qualities quiet, but firm at unchanged prices.

### MISCELLANEOUS CHEMICAL MARKET.

Business is active, and makers are well under orders for all the products of the alkali trade. Caustic soda continues to have an advancing tendency, and there is good demand for export. Spot prices are, meantime, unchanged, viz.:—F.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 10s.; 70%, £7. 10s.; 60%, £6. 10s. per ton, 10-ton lots and upwards. Bleaching powder is still in active inquiry, at £7. 10s. f.o.b. Liverpool; f.o.b. Tyne, £6. 15s. per ton. Chlorate of potash remains at 4½d., though some small resales have been done at ¼d. lower. Chlorate of soda, 6½d. per lb. For ammonia alkali, 58% makers' price is firm at £3. 7s. 6d. bags, f.o.b., and £3. 15s. f.o.b., in casks. Some resale lots are offered at 2s. 6d. per ton lower, but there is no material quantity to be had thereat. Sulphate of copper lower, at £15. 12s. 6d. to £15. 15s., f.o.b. Nitrate of soda is unchanged in position, and selling on the spot at 7s. 6d. per cwt. Acetates of lime are slightly firmer, but spot prices nominally unchanged, at £5. 5s. and £8. per ton respectively, c.i.f., for brown and grey quality. Acetate of soda in good request, at £14. 11s., c.i.f. White acetate of lead quiet, at £21. 10s., c.i.f. Brown sugar of lead scarce. Acetic acid without change. Yellow prussiate of potash, 7¾d. to 8d., according to make. Cyanide 98/100% selling at 1s. 3d. to 1s. 4d. per lb. White powdered arsenic continues scarce. Aniline oil and salt are firmer in price, owing to position of raw material. Murate of ammonia steady, at £22. 15s. to £23. Carbolic crystals still in good demand, and price firm. Sulphocyanides quiet, and prices unaltered. Zinc salts firm. On the whole, trade is reported rather quiet in the manufacturing districts.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

**OILS.**—There is nothing doing in palm oil, the market being very dull and prices uncertain. Olive keeps steady in price, with a fairly good consumptive demand. Linseed continues firm at 21s. 6d. to 22s. per cwt. for Liverpool makes in export casks. Cottonseed is quiet, and prices are easy at 17s. to 17s. 6d. per cwt. for Liverpool refined. There is but a poor inquiry for castor oil, yet sellers are firm at 2½d. per lb. for good seconds Calcutta, and 2¾d. per lb. for first pressure French. Tallow is only moderate, the inquiry being small, though prices are favourable. Resin is not likely to change much from its present position while prices remain so firm, though the inquiry certainly keeps fairly good. Spirits of turpentine are rather easier than last week, though they close steadier than they were a day or so since. Spot parcels are obtainable at 21s. 9d. per cwt. Petroleum steady: American 7¾d. to 8½d., Russian refined 7d. per gallon.

**COLOURS** are steady, without alteration in prices. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## TYNE CHEMICAL REPORT

TUESDAY.

As yet there is very little doing in the chemical trade. Soda crystals are quoted at £2. 2s. 6d. per ton, gross weights, locally. Sulphur continues scarce at £3. 17s. 6d. per ton. Caustic 76/77° £9. 5s. and 70° £7. 10s. to £7. 15s. per ton. Other prices as under:—

Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett; caustic soda, 76/77°, £9. 5s. per ton, nett; do., 70°, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, nett; gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s. per ton, nett; do., 90/95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, net; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30.

**SALT.**—South Durham salt is steady at 9s. 6d. per ton, f.o.b., Tees.

**COALS.**—Trade is rather steadier, and the prospect is somewhat better. There is a good demand for best steam and gas coals. Coke is firm. To-day's quotations are:—Best Northumbrian steam, 8s. to 8s. 3d. per ton; second qualities, 7s. to 7s. 3d. per ton; small steam, 3s. 9d. to 4s. per ton; gas coal 6s. 9d. to 7s. 3d. per ton; bunker coals, unscreened, 6s. to 7s. per ton; household coal, steady, 10s. to 11s. per ton; coke, 14s. 6d. to 15s. per ton.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

Since last report a serious rupture of an overt character has taken place in the solid paraffin combine between the Scotch and American producers. The agreement has for long been known to be sickly, but now the Americans openly refer to the matter as once more at an end, owing to the underselling that has been going on. The prices of scale and wax given below are still the agreement prices, and some makers are faithful to that yet, but they have undoubtedly been purchased for less. Parties to the ruptured agreement are to meet in London next week to confer and ascertain if there is any remedy. Mineral oils are steady at the old quotations, and the burning variety is in great request *ex contracts*, this being the height of the season. Sulphate of ammonia is possibly a shade less feeble, but no more than a shade, and nothing is talked of for forward. The general market is quiet, and a few of the works have not yet resumed production after the holidays, but prices on the whole are very well maintained, and improvement is looked for if foreign complications do not seriously intervene.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali,

48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. 10s. nett, Glasgow; caustic soda, white, 76° £9. 5s., 70/72° £7. 10s., 60/62° £6. 10s., and cream 60/62° £6. 10s., all nett, Liverpool; bleaching powder, £6. 15s. to £7. 5s. nett, Tyne; saltcake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¾d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4¼d. less 5%, Liverpool; nitrate of soda, 7s. 7½d. to 7s. 10½d.; sulphate of ammonia, £8. 10s. prompt, f.o.b. Leith; sal ammoniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £16. 2s. 6d. to £16. 7s. 6d., less 5%, Liverpool; paraffin scale, hard, 2½d., and soft, 1¾d. to 2½d. per lb.; paraffin wax, 120° semi-refined, 2¾d. to 2¾d.; paraffin spirit (naphtha), 7½d. to 8d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6¾d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £4. 15s. to £5., 885° £5. 5s. to £5. 10s., and 890/895° £5. 10s. to £6. Week's imports of sugar at Greenock were 15,318 bags beet unrefined, and 900 bags beet refined.

## HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

**OILS.**—The summary of the year's volume of business of this port does not show any decided improvement upon the past year, still, considering the intense competition of other ports, Hull has fairly well maintained its position. Some sections of trade have been drawn to other ports owing to some extent to the inadaptability of the railway companies interested here. The import of linseed this week has been 19,320 qrs. Linseed oil is about 7s. 6d. per ton dearer, closing very firm at 19s. per cwt. naked spot. This is also the quotation for Jan.-April or May-August. Boiled and refined ditto, £1. to £2. per ton extra. Export for week, 480 cwts. During the week 7,068 tons of cottonseed have arrived here from Alexandria. Refined cotton oil steady at 14s. 10½d. naked spot, Jan.-April quoted 15s. 4½d., and May-Aug. worth 16s. Crude, 13s. 6d. naked spot. Barrels, 30s. per ton extra. Casks, £1. per ton extra. Export of refined, 3,160 cwts. Olive oil easier. Spanish can be bought at £31. per tun. Spirits of turpentine dearer, 22s. 6d. per cwt. Cod oils from £17. to £19. per ton. Castor oil from 2½d. to 2¾d. per lb. for first pressure. Boiled siccative oil, £13. per ton. Liquid soap, £16. per ton.

**CAKES.**—Linseed cakes dearer; 95% pure, £6. 5s.; Russians, £5. 12s. 6d. to £5. 15s. Oil cakes, £5. 2s. 6d. to £5. 5s. Cotton cakes, in sympathy with seed, are dearer; best makes, £3. 15s. to £3. 17s. 6d.; seconds, £3. 10s. to £3. 12s. 6d. Rape cakes: Black Sea, £2. 7s. 6d.; East India, £3. 7s. 6d.; feeding, £3. 12s. 6d. per ton.

**PAINTS.**—Makers open the year with a satisfactory prospect, which the continued open weather tends to foster. ## LATE ADVERTISEMENTS.

**AGENCIES.**—Works in Midlands, with ample Storage accommodation and centrally situated, is open to take up Sole Agencies for the United Kingdom for first class firms only.—Particulars and terms to "SPECIALITIES," *Chemical Trade Journal* Office, Manchester.

**CARBONATE OF BARYTES** for Sale.—No. 1, 95 to 99 per cent.; No. 2, 92 to 94 per cent.—Apply, "BARYTES," *Chemical Trade Journal* Office, Manchester.

SUBSCRIBERS ARE REQUESTED TO NOTE THAT THE

## INDEX and TITLE PAGE for VOL. XVII.

WILL BE ISSUED WITH NO. 457, FEBRUARY 22, 1896.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

Readers will oblige by making their remittances for subscriptions by Postal or Post Office Order, crossed and payable to "Davis Bros."

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

20 Word and under..... 2s. 6d. per insertion.  
Each additional 10 words..... 6s. 6d.

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

30 Words and under..... 1s. 6d. per insertion.  
Each additional 10 words..... 3s. 3d.

TO survey the past year and say off-hand in what particular manner it has been characteristic is almost impossible, and yet it has been noteworthy. There have been several changes of a radical nature, and there have also been new developments, which at present can only be said to be in the problematical stage, though full of promising possibilities. Looking at the events of the year from all points, however, we are prone to the opinion that the last twelve months has been essentially a period of fulfilment, for in the majority of instances it is the events of previous years that have either been further elucidated or carried to maturity. The chemical trade has mainly provided the revolutionary incidents, but if due consideration is accorded to the other classifications into which we usually divide this summary, it can be plainly seen how many of the advances have been in reality works of completion. Strikingly is this the case with

### ADVANCES IN SCIENCE,

in which the establishment of Argon, and the addition of Helium to the list of elements, stand out most prominently. In this connection a very large amount of work has been done, particularly on the nature of the gases given off by various minerals when acted on by acids. Much investigation has also been prosecuted in determining the precise character, composition, and properties of these two juvenile members of the chemical family.

In general research a great deal of interesting work has been carried out, and there is good reason to hope that this somewhat neglected branch of science will receive increased attention in the future, as, with the inception of the Salters' Company Research Fellowship, other research Fellowships have been started, and are bearing good fruit. The chief advances in connection with low temperature research have been of a nature that renders them equally entitled to consideration under the head of technology, but we have dealt with them here, because, in spite of Professor Dewar having devised means by which liquid air and other liquid gases can be easily, and comparatively cheaply, obtained for demonstration or inquiry, the bulk of the work is as yet more or less of purely scientific interest. Before leaving this matter we ought to add that as far as we can learn Professor Dewar's success is largely due to his having adapted the Linde apparatus that has so long and satisfactorily been used in connection with cold storage.

In relation to gases Mond, Ramsay, and Shields have been busy studying the occlusion of hydrogen and oxygen by platinum black; J. J. Thomson has been giving his attention to the electrolysis of gases, a most interesting subject; and the nature and physiological action of "black damp" has been investigated by J. Haldane. With regard to work bearing on more general subjects we have the researches of Vernon arcourt on the "Laws of Connection between the

Conditions of Chemical Change and its Amount;" of Divers and Haga on the "Constitution of Nitrososulphates;" of Perman on the "Escape of Gases from Solutions of Varying Concentration;" and Reddrop and Ramage's "Inquiries into the Volumetric Estimation of Manganese." This, so to speak, is the pick of the research work of the year as far as this review is concerned, though, of course, there has been an abundance of good work done in subjects of less direct interest. Moreover, we have purposely omitted to mention several important investigations that have been executed on special products, or in specific spheres, as it is desirable that they should be individually dealt with under

#### TECHNOLOGY.

Technical education is being as actively propagated as ever, and is perhaps a little better understood. Many of the important schemes of previous years are now on a working basis, and it remains to be seen what measure of success will attend their application. Thus, the Schorlemmer Laboratory at Owens' College has been completed and opened, and, to judge by the progress since last May, will form an able ally to the extensive textile dyeing and printing industries of the Lancashire district. Among technical schools proper, the Birmingham Municipal School was finished with the close of the year, being opened on December 18th last by the Duke of Devonshire. The building of the Salford Technical School, which promises to be one of the largest in the country, is completed. As a building it is undoubtedly fine, and we only hope that the interior equipment will be wholly in keeping with the exterior. The City and Guilds of London Institute steadily perseveres in its ever increasing sphere of work and utility. The number of students under its control keeps as large as ever, and the entries for the technological examinations were 12,864, an increase of 386 on 1894. The certificates of the Institute are now competed for in 315 centres in the United Kingdom, as well as in New South Wales, New Zealand, Natal, and Bombay. The percentage of failures is decreasing, having fallen from 44.6 to 43.4.

While on the subject of technical education abroad, it may be mentioned that since so much is being said about what we have to learn from Germany, Switzerland, and the United States, we have given elsewhere, in this issue, an outline of the curriculum of what is considered one of the best technological schools in the States. In addition to the efforts that are being made at the Leeds College to apply science to tanning, this industry has been further strengthened and benefited by the opening of the tanning school and laboratory at the Herold's Institute, Bermondsey, in affiliation with the Borough Polytechnic. The practical research department of the Imperial Institute is beginning to look up, and since its inauguration, promising investigations have been in progress upon Indian iron ores, coals, fibres, dyestuffs, tanning materials, turpentine, and various oils and extracts, in addition to iron ores, limestones, and iron oxide paints from New Zealand. A glance at these widely varying products will show how diverse are the industries which will probably derive benefit from these experimental investigations.

To make but passing mention of all the leading technological features of the period under review would entail much aimless repetition, as it is to these matters that our columns are chiefly devoted. It is expedient though that we should here enumerate some of the principal subjects in which "technological research" has been practised. By so doing we chronicle what may be termed the master researches, from which the numerous correlatives may be traced in any desired direction, by those who are seeking information, but have not yet scented the trail. Thus the dyeing craft will be interested to hear of the work of Dr. Perkin on the roots of the *Polygonum Cuspidatum*, the extract of which resembles madder, other members of the same genus giving indigo blue and yellow colours; also the roots of the *artocarpus integrifolia* indigenous to India and Burmah, while the same worker has extended our previous knowledge of kamala. Dr. Schunck has been devoting further attention to yellow colouring matters, as well as studying the chemistry of chlorophyll in conjunction with Marchlewski, and Geldard has been investigating the composition of Persian Berries. The coal and other industries will derive enlightenment from the work of Dr. Clowes on the Composition of Extinctive Atmospheres produced by Flames; the gas industry by Lewes's study of the Luminosity of Flames; and papermakers by Messrs. Cross and

Bevan's contributions to the Chemistry of Cellulose. The thanks of biologists are due to Dr. P. E. Frankland for revealing something of the conditions of Bacteriological Life in Thames Water, and to Messrs. Frankland and Ward for their fourth conjoint report on the Bacteriology of Water. In reference to this subject it is, moreover, pleasing to record the decision of the Glasgow Town Council to equip a complete bacteriological laboratory for the Health Department. The mining industry can, and ought to, gain help from the experiments made by J. S. MacLaurin upon the Action of Potassium Cyanide Solutions on Gold and Silver, the special investigation of which matter will impress the observant with the important bearing which the development of the chemical extraction of gold has upon the

#### CHEMICAL AND ALLIED INDUSTRIES.

We should again transgress and defeat our object if we were to dwell at length upon the alkali combination and the pronounced developments in electro-chemistry and metallurgy appertaining to the production of alkali and aluminium, though their recital would constitute some of the most startling passages of the year's history. We must, therefore, pass to equally interesting if less momentous matters. The trades with which we are concerned have to congratulate themselves upon the satisfactory re-construction of the Weaver Trust, and the Salt Union upon the healing of that long-standing sore, the Brine Pumping Compensation Area. After several years of unrelaxed perseverance, Mr. L. Mond is now able to work up 1½ tons of nickel per week from nickel copper matter by his nickel carbonyl process. The efflux of time has brought the alkali trade a new and promising Chief Inspector to exercise a watchful, and when necessary corrective, care over its works, and in connection with this industry reference may be made to the additions to the central management of the United Alkali Company, Limited. The hopes of the Scotch oil industry have been raised and dispelled by the beginning and collapse of the solid paraffin combination, and the same industry has tasted slightly the bitterness of labour disputes, owing to the shale miners' strike. The question of river pollution has been fairly prominent, while sewage treatment has oftentimes been a leading theme, the main point of contention having been the efficiency of filters. It is something, however, to be able to say that both Salford and Manchester appear to have all-but settled the sewage *crux* as far as they are concerned. Among matters of minor importance there have been the successful establishment of the chemical and wood pulp import trades at Manchester, the Tebessa phosphate dispute, and the erection of the first important paint mills in Ireland.

The year has been fraught with many interesting business changes, the following important firms having converted their concerns into limited liability companies:—Messrs. S. G. Bailey and Co., Ltd., Bindley and Sons, Ltd., J. Fison and Co., Ltd., Hanger, Watson, and Harris, Ltd., Mear and Green, Ltd., E. Packard and Co., Ltd., Sharp Bros., Ltd., and J. Woolley, Sons, and Co., Ltd. For business reasons Messrs. Levinstein, Ltd., and Galloways, Ltd., reconstructed; the Cheshire Alkali and Salt Co., Ltd., doing the same on financial grounds. Among the entirely new ventures we find The South African Saltpetre Fields Co., Ltd., Hyatt's Sulphate White Lead Co., Ltd., The American Alkali Co., Ltd., The Castner-Kellner Alkali Co., Ltd., The Kali Syndicate, Ltd., and the Scottish Oil and Chemical Co., Ltd.

There has been no paucity of instructive legal cases, for the highly important Cyanide Gold Recovery case has been brought to an end; the Cordite appeal has been disposed of; the long protracted litigation between The Salt Union and Deakin has been concluded; while such cases as Leonhardt v. Kalle, Lancashire v. Roburite Explosives Co., Ltd., Mersey and Irwell Joint Committee v. Salford Corporation, and the Barff and Bower Patent case have likewise been features of the year.

Passing to the inventions of the year, the activity that has been displayed, as shown by the

#### PATENTS IN 1895.

has been considerable, though the actual numerical total of 25,053 is the lowest since 1892. We believe, however, that in two cases the progressive number stood against a blank, making the actual number of applications 25,051 for the year. There has been an increased crop of patents referring to chemical and electro-chemical processes, while

fertilizers have seemingly received additional attention. Of applications for letters patent for *Chemical Processes* there have been 282; *Chemical Plant and Apparatus*, 99; *Electro-Chemical Processes*, 51; *Electro-Chemical Apparatus*, 19; *Paints and Pigments*, 31; *Sewage*, 30; *Artificial Fuel*, 16; *Oils and Fats*, 35; *Smoke Prevention*, 22; *Soap*, 29; *General Hygiene*, 10; *Explosives*, 9; *Manures*, 29; *Boiler Disincrustants*, 5; *Artificial Stone*, 9. By comparing these figures with those given in the *Journal* No. 400, p. 34, it will be seen that there have been several fluctuations in the minor subjects, in which the decreases predominate, but, on the whole, the rise in the totals of the three first, and most important items, lead to a net increase.

Owing to various reasons,—notably the General Election,—things have been quiet in connection with

#### LEGISLATION.

No Acts of importance have been passed, but there are one or two matters in the wind which will need close attention shortly. For instance, Mr. H. Samuel gave notice in September of a Bill to Regulate the Hours of Labour in Chemical Works, which is likely to be heard of next Session. Then we have two new committees sitting to inquire into dangerous occupations, and further legislation affecting animal manure and one or two other trades is not improbable. A fresh inquiry upon the flashpoint of burning oils is promised, and it is yet doubtful whether something in the shape of more definite control may not result from the inquiry upon the compressed gas industry. In connection with legal matters it is interesting to note that the New Commercial Court has been instituted and gone off well, while Chambers of Arbitration still thrive.

There is now little that remains to be said concerning '95 save upon a few

#### MATTERS OF GENERAL INTEREST.

The gas industry has been marked by eventful progress. The ultimate part acetylene will play is hard to delineate, and general opinion is not very favourable as to its future. Nevertheless, it is as well to remember that at one time a wickless flame was tabooed as a snare and delusion. Incandescent gas lighting continues to grow in favour, in regard to which a pretty little patent law puzzle threatens to present itself. Parallel with the steady growth of the electrical industries a new field has been opened up for the now somewhat obsolete illuminant—oil, since the development and introduction of horseless or motor carriages bid fair to grow apace. Side by side with this French revival comes the approaching adoption of the Metric System, while another sure sign of quiet progression is the ever increasing endeavour to promulgate hygienic principles and their practice.

By this reference to progression our thoughts instinctively turn towards the future, and in so doing we must close the chronicles of 1895. The future is always, and perhaps mercifully, a closed book, the pages of which can only be read by us in the past tense. The present is just now a period of expectations and possibilities, the fulfilment of which is awaited with fears as well as hopes. One thing is certain. We have experienced bad times during recent years, and though trade is moving in the right direction, it shows no promise of improving by leaps and bounds; yet despite everything, the past year testifies to successful completion in many directions. Truly the uses of adversity are sweet. If the future is fairly faced with the fortitude that these considerations should inspire, there need be no forebodings about the records of the current year, in spite of the badly "tempered" condition of that mainspring of all industries, coal.

**ESTIMATING IRON IN OLEINE.**—Place 100 c.c. of the oleine to be tested in a graduated tube, provided with a glass stopper, add 20 c.c. of dilute  $H_2SO_4$  (1:1), and a few drops of yellow prussiate of potash solution (about 10%). After well shaking add 25 to 50 c.c. of ether, and again thoroughly shake the whole. The fatty acid dissolves in the ether, and the latter easily separates from the acid water on standing. If iron is present a deep blue colouration will be manifest at the junction of the layers. The test can be made quantitative by comparing the colour with that of solutions containing known quantities of iron.

### THE DUFF PATENT GAS PRODUCER.

THERE are several different kinds of producers employed in chemical works, the oldest of which is the Siemen's Producer, with horizontal grate bars, and a slow draught. The application of a steam blower to this producer increases greatly the amount of fuel gasified, but at the same time produces a large amount of clinker, during the removal of which gas cannot be made.

FIG. I.

The Duff Producer, as will be seen in Fig. I., has a water seal at the bottom, and a sloping grate. Added to this there is a steam blower. The formation of clinker is avoided both on the grate bars and on the sides of the furnace, as the blast passes up the centre. Another good feature is that as the ashes fall from the grate they are easily raked out of the water trough, and fresh fuel is continuously fed through the

FIG. II.

hopper, so that the supply of gas is always regular. All these items mean a great saving of labour in the working, which is said to amount to about 30 per cent., as well as a saving of fuel, for no gas can escape on account of the water seal.

The producer we inspected was working with coke breeze, and the gas was very clear when ignited by the admission of air, whilst the temperature was regulated very easily in a similar way. The quantity of gas made depends on the regulation of the steam blower, and the plant can be easily stopped. There have already been 150 gas producers of other types altered to this system, thereby doubling their production, and in some cases more than trebling it. We understand that, practically speaking, any existing producer can be altered to this system, Fig. II. showing a Siemen's Producer altered by the addition of the Duff grate, water bottom, and steam blower. The makers are Messrs. W. F. Mason, Limited, engineers, Longsight, Manchester.

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

- Improvements in Treating Linseed Oil. J. E. Bedford and C. S. Bedford. 5. January 1.  
 Anti-Incrustation Fluid. C. B. Moore and F. Turner. 48. January 1.  
 Improvements in Apparatus for Burning Cement-making Materials, Lime, Chalk, etc., and Obtaining Carbonic Acid Gas therefrom. W. R. Taylor. 63. January 1.  
 Preventing and Removing Boiler Incrustation. G. Bailey. 102. Jan. 2.  
 Improvements in the Process of Extracting Metals from Solutions. H. F. Julian. 128. January 2.  
 Improvements in the Prevention of Phylloxera. J. Fuchs. 132. Jan. 2.  
 Improvements in the Manufacture of Paper Pulp from the Broom Plant. H. H. Lake. 210. January 3.  
 Improvements in Apparatus for the Treatment of Smoke, etc. R. Moodie. 233. January 3.  
 Improvements in Apparatus for Degreasing and Scouring Wool, etc. G. E. Wright and W. Monk. 240. January 4.  
 Rendering Waste Leather Soluble and Applicable as a Manure. J. Hudson. 289. January 4.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal and ALL RIGHTS of publication are RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

- Improvements in Plant for Distilling, Cracking, or Gasifying Oils, Tars, or any Liquid Hydrocarbons. R. V. Horsfall, Slaithwaite, Yorkshire. Eng. Pat. 2,188. Jan. 31, 1895.

The object of this invention is to so set the retorts that they are subjected to a progressively-increasing temperature. To this end, the retorts are set in tiers, either horizontally or at any desirable angle, each retort being enclosed in a separate heating chamber through which the gases from an adjacent furnace are caused to circulate. In this way, it is claimed, gas of high illuminating power can be more readily produced. For particulars, the specification and the nine accompanying drawings must be consulted.

- Process for the Production of Caustic Lyes of the Alkalies. O. Imray, 28, Southampton Buildings, Chancery Lane, London (communicated by the Chemische Fabrik Rhenania, Aachen, Germany). Eng. Pat. 3,485. Feb. 18, 1895.

This invention aims at utilising all the caustic lime when causticising alkalies, and facilitating the removal of the latter in the washing process. The vessels used have a grating at the top to prevent accidents, with a central opening which permits the introduction of a sieve-like vessel containing lime. At the bottom provision is made for the introduction of steam. The first stage of the process is as follows:—Crude carbonated lye is diluted with previous washwater to 17° B., and steam blown in until a temperature of 70° C. is reached, bringing the gravity down to 14° B. Lime is placed in the sieve basket, and is rapidly taken up by the solution. The steam supply is then cut off, the sludge settled, and the caustic lye run off to be worked up into solid caustic. To the sludge a fresh batch of carbonated lye is added, diluted, and boiled up until the whole of the caustic lime is utilised.

The partially-causticised lye is then run off, and the residue removed; the half-finished lye being treated with more lime in the manner described until perfectly causticised, when the cycle of operations thus completed is once more begun. The consequences of this process are the saving in lime and the better extraction when washing the sludge, owing to its consisting wholly of calcium carbonate instead of a mixture of carbonated and caustic lime. The causticising of the alkali is almost entirely complete, but a perfect conversion can only be achieved in a state of dilution, which is impracticable owing to the cost of concentrating such weak lyes.

- A Substitute for Indiarubber, Guttapercha, and Substances of a like Nature, and Process of Manufacturing the same. E. Hornung, XVIII., Weinerstrasse, 76, Vienna, Austria. Eng. Pat. 20,243. Oct. 26, 1895.

The substitute consists essentially of a mass of glue precipitated by chemical reagents. Thus an aqueous solution of any common glue, or glue substitute is precipitated with tannic, or muriatic acid, alum, or chlorine if in the presence of stannate of soda. To the mass a small quantity of rubber, &c., is added, and any inert substances, as pulverised cork or other fibrous and mineral products of a desirable nature. If the substitute is to be kept soft, vaseline, fats, oils, or glycerine are also finally incorporated.

- Improvements in the Treatment or Oxidation of Fixed Oils, Fats, and the like, and the Application thereof as a Menstruum for Paint, Varnish, Oilcloth, and the like. S. Banner, 8, Fazakerley-street, Liverpool. Eng. Pat. 24,103. Dec. 11, 1894.

In the oxidation of linseed oil by simple blowing and heating without the aid of dryers, the oil at a certain point gets so solid that it can be treated no further, and is moreover practically insoluble in ordinary solvents. By this process, however, a very highly oxidized oil is obtained, which is nevertheless a viscid liquid. This is very simply accomplished by adding a light hydrocarbon during the usual blowing process, before the oil reaches that stage of solidification at which it is insoluble. If an exceptionally high oxidized oil is required, dryers (and more particularly the compounds known in commerce as the acetate or borate of manganese) are also used.

- Improvements in the Electrolytic Treatment of Tin, and its Separation from Alloys and Mechanical Mixtures. C. F. Claus, junior, Waunarllydd, near Swansea, and H. S. Sutton, Neath. Eng. Pat. 297. Jan. 4, 1895.

Tin is recovered from "scrap" by immersing in a bath of alkaline sulphide, which is preferably heated, and contains 1 part of sulpho-stannate of soda and 2 parts of water. A current of about 10 amperes per square foot of anode is then sent through, the material itself being used as the anode and the separated tin deposited on a suitable cathode. If the deposit of metallic tin should contain arsenic or antimony, the deposit is immersed in a bath of dilute hydrochloric acid, to which hyposulphite of soda is added as required, and a current again sent through.

- Treatment of Drying Oils. E. Andreoli, 18, Somerleyton-road, Brixton, S.W. Eng. Pat. 25,324. Dec. 31, 1894 (under International Convention July 20, 1894).

The oils are oxidised by means of ozonised air or ozonised oxygen passed through them at a gentle heat. The superoxidation is hastened by the addition of hydrocarbons boiling over 100°C. or of tallow. Previous to the ozone treatment the oils have to be freed from albuminous matters, &c., with tannin, &c., otherwise the albuminous and mucilaginous bodies form an insulating layer around the molecules of the oil, hindering the oxidation. To oxidise the oil to solidification point it is put through a series of glass plates stacked between pointed grids as detailed in patents 17,426/91 and 9,631/92. The oil is converted into a white solid, which can be removed from the plates by scraping or otherwise.

THE ESTIMATION OF ARGON.—A method for the quantitative determination of argon has been brought before the Academie des Sciences by M. Schloesing, jun. The method does not vary materially from that proposed by Prof. Ramsay, only M. Schloesing has found that instead of using very large volumes, 1.5 litres is sufficient if all the measurements are accurately made over mercury. The O and CO<sub>2</sub> are absorbed in the usual way and the mixture of nitrogen and argon passed over magnesium, leaving pure argon.

## Paper-Makers' Column.

### PREPARING BLUE-MOTTLED PAPERS FROM DYED CELLULOSE.

[SPECIALLY CONTRIBUTED.]

In the preparation of coloured papers the operations and methods of the dyer are generally perfectly applicable. The two cases are indeed parallel, although there is a difference, inasmuch as, in the case of dyeing cotton and linen fabrics, the process of fixing the dye upon the fibre must necessarily be more complete, as mostly all of these fabrics are washed while they are in use, whereas paper is never subjected to this treatment. The coal-tar dyes are the most suitable for the preparation of nearly all coloured papers. In some cases, however, other mineral lakes, or inorganic dyes, as they may be called, are used.

The main point to be observed in dyeing paper pulp is first to get the fibre in such a state that it will retain the dyeing agents upon its surface. The re-agents most frequently used for this purpose are tannic acid, alum or sulphate of alumina, and the salts of lead and iron. Some of these have the power of fixing or attracting the dyeing matters, forming with them insoluble compounds. Some, on the other hand, combine with another salt, producing the coloured lake itself. As examples of this latter class, we have the formation of Prussian blue from ferric salts, and yellow prussiate of potash and of alizarine reds and pinks from basic alum and alizarine paste. The aniline dyes are "fixed" with various mordants—tannic acid, alum, and soluble lead salts being the most frequent in use, and some of which exert a more or less powerful influence in the shade of the colour produced. For example, with lead acetate, eosine throws up a blueish red, whereas with sulphate of alumina or alum the red assumes a fiery tone.

When pale colours are needed the process of tinting the pulp is simple, and generally requires little or no mordant if due care is exercised that the original colour of the fibre is sufficiently good to start with. When, however, very fast and deep shades are required, such as navy blue, the dyeing of the pulp must be carried out with care and precision so as to get the whole of the colour well fixed in the fibre.

Thus it is that in the manufacture of red and blue mottled papers, the dyed fibres have hitherto been derived from selected Turkey red and navy blue cotton and linen rags, which form the basis of the mottle. These rags after careful washing are beaten up by the themselves in a separate engine, and when sufficiently fine are added to the other white or tinted stock in a second engine. The amount of pulp required to produce the mottle is very small, being in many cases not more than one half of a per cent. of the whole contents of the engine.

The foregoing is unquestionably a simple and certain method of preparing mottled papers, but the necessity of producing cheaply has given rise to the following method of dyeing wood cellulose for the preparation of blue mottled papers.

In the absence of a sure and easily-applied method of dyeing with indigo, a prussian blue formed by the action of yellow prussiate of potash on an iron salt, with subsequent oxidation with a hypochlorite, is adopted. The pulp taken is ordinary unbleached sulphite, but soda or sulphate cellulose are equally suitable, and the pulp is well brushed out in the engine to ensure complete disintegration of the fibre, and partly "beaten" to ensure regularity of length, while if heated to 140°F. the mordanting process will be facilitated. After this the nitrate of iron mordant, which consisted of 5 per cent. of the weight of the pulp together with an equal weight of basic sulphate of alumina, is added. Alumino-ferric cake is as suitable, and much cheaper to use than sulphate of alumina or alum. The term "basic" as here applied means that the acid property of alum is partly neutralised by adding to the alum liquor a small quantity of soda crystals, dissolved in warm water, till flakes of hydrated alumina are precipitated. On the addition of the iron and alum liquor the pulp assumes a rusty brown, due to the deposition of basic salts of ferrous and ferric oxide. These iron salts are so firmly "fixed" that no amount of washing will remove them, and so the deep blue lakes they form with yellow prussiate of potash are naturally also "fixed" on the pulp. After the pulp has taken up as much of the iron

as it will, it is advisable to wash it thoroughly to remove the traces of the ferrous and ferric salts still remaining in solution.

Eight pounds of yellow prussiate of potash are then weighed off for every 100 lbs. of dry pulp, and when dissolved in warm water the solution is gradually added to the engine while the pulp is circulating. The best way to do this is to syphon the prussiate solution into a perforated shoot placed across the engine in front of the roll. This ensures perfect distribution of the solution and a more uniformly-dyed pulp.

The blue colour produced is by no means bright. On the contrary, it is dull, and it is necessary to add an oxidising agent to get the characteristic bronze-blue shade; bleach of 7° Tw. is used for this purpose, using 3 gallons to 100 lbs. of dry pulp. It should be added in the same way as the yellow prussiate. Should any free chlorine be evolved, this will not interfere with the blue, but, on the contrary, will add to its brilliancy.

After thorough mixing by continued circulation the dyed pulp is thoroughly washed. It may happen that the colour will lose its brilliancy by washing too much. This, however, is not a serious matter, as the addition of a little alum will generally brighten it again. In summarising the process we arrive at the following:—For every 100 lbs. of dry pulp we require 5 lbs. nitrate of iron, usual strength; 5 lbs. alumino-ferric cake, rendered basic with solution of crystal soda as described; 10 lbs. yellow prussiate of potash; and 3 gallons of 7° Tw. bleaching powder solution, diluted with the same bulk of cold water.

The pulp, after dyeing and washing, is run into the draining chest, and allowed to remain there a few days before use. When using it, it is added to the other paper stock, when the latter is nearly ready for the stuff chest. A good mottle will be produced in this way, and if ordinary care and skill be exercised in the dyeing it will not bleed, so as to alter the original "ground" of the ordinary "stuff" of which the paper is made.

### MECHANICAL WOOD PULP IN SCANDINAVIA.

[SPECIALLY CONTRIBUTED.]

Mechanical wood pulp, or ground wood, was invented by Gottlob Keller about 50 years ago. At that early period it found a very spare market owing to the quality not being considered good enough to be manufactured into paper. Its short nature, and lack of felting power, went strongly against it, but since that time it has gradually increased in consumption, being now produced in vast quantities for the production of cheap printing papers. By itself, although it can be made into a respectable sheet of paper, it is not used; but is usually blended with the so called wood cellulose or chemical wood pulp. The papers upon which our newspapers are printed are composed almost exclusively of wood cellulose and mechanical wood pulp, in the proportion of 10 to 20 per cent. of the former to 90 or 80 per cent. of the latter. England not being a wood producing country, this pulp is not manufactured here. It is, however, imported in large quantities by English paper making companies for the production of common papers and those named above.

The principle of its manufacture has not been altered since the days when Gottlob Keller first made it; but the apparatus in detail has naturally been much improved. Stated in the simplest way, the manufacture consists in grinding white spruce to a fine powder by the aid of revolving sandstones. Sometimes poplar is used, the resulting pulp being whiter and softer than that made from spruce. In point of fact, the pulp partakes largely of the character of the wood from which it is made. Poplar, although yielding the finer quality of pulp, does occur abundantly enough to make its use universal, and hence almost the whole of the mechanical wood pulp used in the paper industry is obtained from white spruce. Even this varies in character in different countries, and with the soil upon which it grows. Canadian spruce, it is said, yields a better pulp, that is, a pulp softer, more pliable, and whiter than the spruce found in Scandinavia. This is declared to be the case by those practical paper makers who have experimented with both Canadian and Scandinavian pulps. The results are interesting, as pointing to the influence which soil and climate have upon the growth of the pine family, and thus upon a manufacture of universal importance, namely,

the manufacture of cheap papers. It cannot be denied that when once a mechanical wood pulp can be manufactured having sufficient felting power in itself to yield a sheet of paper strong enough to withstand the strain of the ordinary printing press, the use of wood cellulose in the composition of news-paper will cease altogether.

By far the larger part of the mechanical wood pulp used in England is imported from Scandinavia, from Norway and Sweden. The close proximity of these extensively pine covered countries lends itself admirably to a large trade with us in this article, and in view of this we propose touching briefly on the extent of this manufacture in these two countries, and also in brief outline upon the details of the manufacture itself.

#### THE TRADE.

Speaking of works exclusively employed in wood grinding, Norway is the larger producer, although it is less populated, and is the smaller country by far. Its annual production is about 150,000 tons of dry mechanical wood pulp, the three varieties produced being white pine, poplar (or aspen), and brown pine pulp. The output of brown and aspen is, comparatively speaking, very little less than 5 per cent. of the whole. The production of these 150,000 tons of dry pulp per annum represents an available water power equal to 150,000 horse power. This power is generally derived from the natural waterfalls occurring in the country, and which may be said to be capable of supplying an unlimited quantity of mechanical force for industrial uses.

The number of works in Sweden employed exclusively in this manufacture are more numerous than in Norway, but on an average are not so large. They vary in manufacturing capacity from 1,000 tons of wet pulp per year to about 13,000 or 14,000. The ninety factories or so in active work produce about 120,000 tons of dry pulp per annum, representing in the aggregate about 120,000 horse power. As in Norway, the whole of this power is derived from waterfalls.

Besides the above quantities there are many factories in both countries that grind wood pulp for their own use. These are chiefly paper and mill board works, and consume annually large quantities of wood for this purpose. Not unfrequently the pulp manufactured in excess of the requirements of these works is disposed of through the usual trade channels.

#### THE MANUFACTURE.

The manufacture as carried on in Scandinavia is run on the following lines. The white pine trees, after being cut in the forests and floated down the waterways to the factory, are taken direct and cut into pieces varying from 15 to 24 inches long. These pieces are then barked in the usual way either by hand or by being held against a revolving disc having a knife fixed in a slot across its face. The piece of wood is turned slowly while being held against the disc to remove the outer bark and as little of the good wood as possible. In some works they prefer to remove the outer bark by placing the cut logs in a large revolving vessel with water, the rubbing action of one log against the other serving to separate the bark from the good wood.

After cleaning, the sheet logs are taken to the grinding room. The grinder varies a good deal in different works, both in design and size. Some employ horizontal machines, some vertical, varying in size from 4ft. to 5ft. diameter, and from 12in. to 24in. in width of face. The grinder consists essentially of a sandstone, fixed firmly by means of two side plates on a shaft which passes through its centre. This stone is encased in a sheet-iron cover, having two or more pockets or square boxes on its upper side for holding the pieces of wood to be ground. These pockets are provided with side doors for the introduction of fresh pieces of wood, and also with movable pistons actuated by chain gearing, or by hydraulic direct acting cylinders, which cause the piston to press the wood forward against the stone. The stones revolve at a high speed, and their grinding faces are periodically grooved diagonally by the aid of a specially arranged steel cutting roller, which is held against them as they revolve. The pieces of wood are laid against the grinding surface of the stone parallel with the shaft, and in the process of grinding a plentiful supply of water is allowed to flow upon its face. The object in placing the wood in this way is to produce a ground product fibrous in character, and so possessing considerable felting power.

The grinding is simply carried out, no labour of a highly-skilled nature being required. There are, however, many points requiring attention if a good product is desired, mainly connected with obtaining the requisite degree of fineness. The condition of the stones, which are generally sharpened or regrooved every 24 hours or so, and the pressure of the wood against the rubbing surface, regulate in some degree the finenesses of the resulting pulp. So, also, with regard to the amount of pulp produced by each stone, which depends upon the fineness of the pulp and upon the mode of sharpening the grinding face of the stones, etc.

The ground wood, with the excess of water, runs into a shoot below the grinder, and is conveyed to the sorters. Then machines strain the pulp into various qualities. In some works only one quality is produced; in others two, and even three, qualities are made. In America and Germany the sorting is carried out in this way, the qualities being separated according to the size of hole through which the ground wood will pass. These sorters, like the grinders, differ widely in design and arrangement, although the principle upon which they act is common to them all. In form and action they are not unlike the ordinary jog strainer. Some manufacturers, however, employ plates, having round holes, instead of the usual slits, through which the fine pulp passes, the size of the hole or slit regulating the quality. All the coarser particles which will not pass through the plates are, in the majority of cases, run away as waste.

The sorted pulp is now allowed to flow into the "stuff" chest of a wet machine, where it is deposited against the wire gauze of a partially immersed revolving drum. The immersed part upon which the pulp is deposited is pressed against a thick woollen felt, which removes the pulp from the wire gauze and carries it to a wooden roller, which in its turn picks it up from the felt and in course of time becomes covered with a thick sheet of accumulated pulp. By a dexterous movement the attendant at the machine inserts a wooden knife in a groove along the face of the roller, and cuts the thick sheet of pulp. It is then removed, placed under a hydraulic press, and subjected to such a pressure that expresses the water, leaving 45 per cent. of dry wood and 55 per cent. of moisture. After being packed in bales it is put on the market as "wet wood pulp."

#### INTERCHANGEABLE TAP PLUGS.

MESSRS. C. H. C. Rudd and Partners, of Thistle Works, St. Anthony's, Newcastle-on-Tyne, have recently made a new departure in regulus, or other suitable metal-bodied taps having interchangeable stoneware plugs.

Taps similar to these have been known to users of corrosive fluids for some considerable time, but have not been generally used, owing to the fact that when a plug was broken another could not be had to fit into the barrel—hence the entire tap was rendered useless, and a new tap had to be fixed.

By Mr. Rudd's new invention this obstacle has been entirely overcome, every plug being made of precisely similar taper and dimensions. If an accident happens there is no need now to abandon the tap, as a plug from a disused tap can be substituted, or, by keeping a stock of additional plugs, a fresh one can be inserted at once without any bother, thus saving time, trouble, and money. It is claimed for taps of this description that they have a longer life than those made entirely of metal, and the stoneware plugs do not tear the metal barrel, but grind themselves in slowly as the tap wears, thus avoiding leaks.

## Oils, Paints, and Colours.

### FLOOR-CLOTH OILS.

[SPECIALLY CONTRIBUTED.]

In the manufacture of linoleum, floor oilcloths, and similar goods, and in the preparation of tarpaulins for wagons, etc., there is a good deal of oil and oil products used as a binding material, or as a water-proofing agent. The only oil which is used in these industries is linseed oil, and its value lies in the fact that when exposed to the air it absorbs oxygen and dries up into a hard, solid mass, of a resinous nature.

In this form it is known as "oxidised oil," and is produced by first boiling the oil with red lead, then pouring the boiled oil over a piece of thin canvas or "scrim," and hanging this oiled canvas in an airy drying-room at 90° to 100°F. When it is dry a further quantity of the oil is poured over the canvas, which is again allowed to dry, these operations being repeated until a mass of oxidised oil  $\frac{1}{8}$  to  $\frac{1}{4}$ -inch thick is obtained. The weight of the oxidised oil so obtained is about 10 per cent. more than that of the original, due to the absorption of oxygen. For the purpose of preparing linoleums this oxidised oil is ground up with kauri gum and resin to form a pasty cement, to which other ingredients in the shape of pigments are added, according to the particular kind of linoleum required. The oil is not fully oxidised, for further oxidation takes place when the oil is made into floorcloth, and so a hard, but elastic mass is obtained. Another method, which is largely adopted in making the compound which is spread over the canvas bottom of the cloth, is to boil the oil with acetate of lead, manganese oxide, and red lead or litharge, while sometimes dried sulphate of iron is used. The proportions of these driers vary with different makers who have each their own ideas on the subject, but the following may be taken as a guide:—For 450 gallons of oil, 33lbs. each of acetate of lead and dried copperas and 6lbs. manganese oxide are required. The length of time for boiling varies, but rather than raise the temperature unduly it is better to boil at a low heat for two or three days, with occasional stirring. By blowing air through, the time of boiling may be reduced fully one-half, while a rather better product is obtained. Oil prepared in this way will be solid, or nearly so, when cold.

There is, however, another form in which linseed oil is used in the manufacture of these articles, and that is in the preparation of the colour used in the printing of the design. For this purpose liquid boiled oils are used. These must have good drying properties, so that the cloth, after printing, can be rapidly dried off, otherwise when rolled up it would stick together.

Generally two qualities of such oils are prepared, one dark in colour, which is used for mixing with dark colours, such as blacks, browns, &c., and the other pale, for use with bright tints, chrome yellows, greens, reds, blues, &c. In preparing these oils it is usual to add litharge and manganese oxide as driers. The dark oil is prepared by boiling quickly at a strong heat, while in preparing the pale oil only a gentle heat is permissible. The quantity of driers used varies from 1  $\frac{1}{2}$  cwt. to 2 cwt. for 500 gallons of oil. The time of boiling ranges from six to eight hours. For preparing all these oils only the best linseed oil should be used, while it should, moreover, have been kept in stock for six months or so before using.

Oil is largely used in the manufacture of tarpaulin covers, and these are either yellow or black, though occasionally an exception may be met with. Such tarpaulins are made by hanging the canvas of which they are formed in a large, lofty room, then painting it with pale boiled oil, or in some cases a mixture of pale boiled oil and raw linseed oil. The object is to produce a coating which will be weatherproof for a reasonable time, and also be sufficiently elastic to stand being folded up and thrown about without cracking. Now raw linseed oil gives the most elastic coat, but it takes longer to dry than boiled oil, and consequently it is preferable to use a mixture of boiled and raw oil for this work. If the boiled oil contains too much of the driers it is liable to give a brittle coat, thereby reducing the wearing qualities of the tarpaulin very considerably. The black covers can be made by mixing the oil with some black pigment like lamp black; or a black varnish

may be made with the aid of asphaltum, stearine pitch, and similar products, and used along with the lamp black. Too much varnish, however, should not be used, or the coating will be very liable to crack, owing to brittleness. As several coats of oil are required, each coat must be allowed to become thoroughly dry before the succeeding ones are applied.

The oils used should, as before stated, be prepared from pure linseed oils; adulterated oils, and especially those containing resin oils, being avoided, otherwise there will be difficulty in getting the coating to dry properly. Baltic linseed oils always work the best. Where the tint is important the Hartley-Blenkinsop "pale" boiled oil may be employed with advantage. Ordinary boiled oils are brown in colour, and therefore will give rise to dark-coloured cloths; but this particular oil is even paler than the usual run of raw oils, and will make very light-coloured cloths.

### DRY SOAPS OR SOAP POWDERS.

[SPECIALLY CONTRIBUTED.]

One important branch of the soap trade of the present time is the manufacture of what are commonly known as "dry soaps." In the popular estimation these are, or at all events were at first, considered to be dried soaps, that is the ordinary soap dried and powdered. This, of course, they are not.

The writer does not know when or by whom this class of soap was first introduced, neither has he ever seen any historical account of them, but that they fill a want is testified by their sale. A few years ago there were only one or two makes, now there are many, nearly every soap maker preparing a dry soap as well as his ordinary kinds, while there are some who do nothing else. The number of fancy names under which they are sold to the public is legion. Some are of excellent quality, while others are but indifferent. The great bulk of the dry soaps are really mixtures of ordinary hard soap, soda crystals, and soda ash, ground to a fine powder. Some contain Glauber's salt in place of the soda crystals. Others contain a little paraffin wax or borax. The price at which they are sold, however, does not permit very expensive materials being employed in their preparation. Different makers mostly hold opinions of their own upon the best methods of making their soaps, but the *crux* is to get them into as fine a powder as possible.

A very good plan is to throw into the pan of an edge runner mill the required amount of soda crystals, soda ash, and soap, and give them a preliminary grinding and mixing, but care must be taken not to continue the grinding too long or the soap will begin to grow pasty. From the edge runner mill the materials are transferred to a disintegrator, in which they are ground to an impalpable powder. The "Devil" disintegrator seems to be well adapted for the grinding of dry soap, as the action is so rapid that the soap has no time to get hot and therefore liable to become pasty, as is the case with some other forms of grinding mills.

The following is an analysis of a well-known make:—Water, 47.85%; soap, 19.25%; sodium carbonate, 32.90%. This soap can be made by taking 25lbs. of a good soap made from tallow and cottonseed oil, and grinding it with 75lbs. of soda crystals. Sometimes such a mixture is apt to work pasty in grinding, especially if the soap be soft. This can be remedied by throwing in a little ammonia-soda.

Another soap contains:—Water, 48.36%; soap, 5.00%; sodium carbonate, 46.64%. This soap is made by taking 6 to 7 lbs. of a good soap, adding 5 lbs. ammonia-soda and 88 lbs. of soda crystals, and grinding them together.

The following is a common make of dry soap:—Water, 50.28%; soap, 7.69%; sodium carbonate, 22.01%; sodium sulphate, 20.02%. This is made by taking 9 lbs. of soap, 46 lbs. soda crystals, and 45 lbs. Glauber's salts, and grinding them all together, adding a little ammonia-soda if required, to keep the material from going pasty.

When paraffin wax is added much the same formula is used, only about  $\frac{1}{2}$ lb. of low grade paraffin wax or scale per cwt. of the soap is thrown in and ground up along with the other ingredients.

In place of soda crystals, ammonia soda may be entirely employed, adding an equal weight of water during the grinding.

Now a few words as to the stock soap which is used in making these dry soaps. Much of the lathering qualities of the powder depend on the quality of the soap used. An excellent soap can be made from bleached palm oil, cotton-seed oil, linseed oil and palm kernel oil. This gives a soap which lathers freely. Another good soap for this purpose can be made from tallow, cotton-seed oil, and coco-nut oil. Whether it is made by the hot or cold process is immaterial; neither is it needful to salt out, for when well made the soap can be used just as it comes from the pan. Should such a soap show signs of going more pasty in grinding than an ordinary finished, hard soap, the quantity of soda crystals should be reduced, and the quantity made up with soda ash, or 58 per cent. alkali. Some makers of these dry soaps have used oatmeal, but with what object it is difficult to say.

#### THE DEVELOPMENT OF PAINT MACHINERY.

[SPECIALLY CONTRIBUTED.]

It is within the recollection of the "oldest" artisan in the paint and colour trades that there was a time when every painter had to prepare his own colours and his own paints as he wanted them. The use of machinery was unknown, and the production of ready-mixed paints, to be bought at a colour-shop at 4d. a pound, was also unknown. Things have changed since then, and the use of paint has greatly increased, this increase of itself necessitating the employment of new and more expeditious methods of production.

In old times the painter used what was known as the slab and muller for preparing or mixing his paints, or he may occasionally have made use of the chemist's mortar and pestle. The slab was of smooth marble or stone, and the muller a rounded piece of hard stone. The material was spread on the slab, and worked under the muller until sufficiently well ground and mixed. This work was commonly entrusted to the youngest apprentice, who must often have found it not only a laborious, but a monotonous task. There is no doubt that in many cases a supply sufficient to last some time would be made, and probably in this way the custom of preparing white lead and other pigment colours in a paste form with oil arose.

The art of house painting and decorating has grown very extensively during the last quarter of a century, and consequently has greatly increased the demand for pigments and paints, and it is now quite beyond the power of manual labour to produce them fast enough. No wonder, then, that mechanical assistance has been called in, and that a new trade has arisen in the production of machinery for paint and colour making, to which many well-known firms now exclusively devote themselves, expending both time and skill in perfecting the machinery they make.

The two earliest machines to be applied to colour grinding were the edge runner and the flat stone mill. Edge runners are now made by a great number of engineering firms for a variety of purposes. They can be had in different sizes, and will be found very useful in the preliminary grinding of earth pigments. One firm has lately constructed a levigating mill, which consists essentially of a pair of edge runners working in a circular tank through which a stream of water can be made to flow. The edge runner mill is also found extremely useful for mixing such products as putty, &c.

The flat stone mill is even a greater favourite with colour, &c., grinders. The general form is that of a horizontal fixed stone, with a conical feed hole in its centre. Against and below this is another stone which is rapidly revolved, the grinding effect being increased by corrugating the grinding surfaces in a special way. In America these mills are largely used, and they there employ a system of surrounding the fixed stone with a water jacket so that it can be kept cool. The old forms of grinding mills have been much improved by modern colour mill engineers, who have increased their efficiency by attention to the details of construction.

The development of the use of machinery in any trade generally leads to the introduction of entirely new types of machinery. This has been the case with paint and colour machinery, in reference to which the records of the Patent Office are full of crude ideas. It will prove extremely interesting for anyone engaged in this industry to spend a few hours in going through the old patents and examine the ideas which are to be found therein. Such an examination could not fail to

be profitable, while it would also prove to be not devoid of humour on account of the many very primitive ideas which have been sanctified by being patented. One of the early inventors in this field tried to adapt mechanical power to the old slab and muller, and, needless to say, failed. Another inventor—we forget his name—taking an idea from his mother's rolling pin and paste board, proposed a machine in which the material to be ground is spread on a slab, over which a heavy roller is pushed backwards and forwards; this, however, was not a practical success. A slight improvement on this consisted in making the roller to work in a groove in a piece of stone, the material being fed between the two; this did not prove very successful, but this patent contained the germ which later on was developed into the roller grinding mill of the present day.

The first patent for these mills stands in the name of Geyelin, but their invention is popularly ascribed to Henry Clark. While Geyelin's mill was very complete and embodied a good many features present in roller mills of more modern construction, yet experience has shown up weakest points which have, from time to time, been remedied by one or two engineering firms, who have thereby prominently associated themselves with these mills, which are now indispensable in every colour and paint works.

The introduction of grinding mills has resulted in teaching the painter one thing, and that is, he cannot have his colours too finely ground. Then, again, he wants his materials well mixed. In consequence new types of colour mills, mixers, and sifters, undreamt of in the old days, have been brought out and developed almost to perfection, for now the materials can be turned haphazard into the hopper of a machine, which then proceeds to sift the fine particles from the coarse, removing the latter, while the former are passed on to be well mixed and finally sent out in perfect condition for the painter's use.

In a similar way the rapid developments in the manufacture of "ready-mixed" paints have necessitated the introduction of new machines. It is to American ingenuity that we are indebted for an efficient form of paint-mixer, which has been received with favour in this country.

There is another form of paint mill—the cone mill—that is to be seen in every paint and colour works and in most paint and colour shops. The form of this mill recalls the mortar and pestle of the druggist, and it may be that it is a mechanical development of the same, only the mortar is made in two pieces. The top portion is fixed and forms a hopper to hold the material which is being ground, while the lower portion plays the part of the pestle, and is made to revolve. The surfaces where the two portions come in contact form the grinding faces, between which the material is ground while passing from the hopper to the outside of the mill. There is not a more efficient paint-grinding mill than the cone mill, whether it be built for dealing with small or large quantities; for dry, friable powders, or for pasty materials.

We have so far mainly devoted our attention to the growth of paint-making machinery, but we might also have said much on the development which has concurrently taken place in the use of machinery for pigment making. The quantity of material now required makes it impossible to adhere to the old-fashioned methods of filtering, levigating, and drying. Consequently, we find that filter presses have become part of the plant of a colour works, while drying machines are now made that are capable of doing in hours what the old methods could only achieve in days. Then, again, for dealing with such minerals as china clay, ochres, etc., levigating mills are now made that will turn out a greatly increased yield of finished material from the crude ore than was formerly the case.

Here reference must be made to those types of pulverising mills or disintegrators in which genuine *grinding* action is obtained by bringing the material between two interlocking teeth projecting from two rapidly-rotating discs moving in opposite directions. The teeth exercise a cutting as well as a crushing action as they rotate, so that these mills are capable of dealing with very tough materials, and will reduce them to a very fine powder. In many directions these mills have been found extremely useful for doing perfectly work that at one time could only be done very imperfectly.

## CHEMICAL DETERGENTS.

In view of the important part played by detergents in the textile, laundry, and kindred industries, we think it may be of interest to mention that Messrs. Joseph Crosfield and Son have laid themselves out specially to supply detergents to suit the finest as well as the coarsest and dirtiest articles, from the finest cambric and silk to greasy cotton waste.

The new specialities prepared by them for laundries, for scouring, dyeing, and bleaching in similar trades, apart from soap, since we last drew attention to the developments this firm is achieving, consist mainly, first, in the production of a remarkably cheap Brown Oil Soap, free from rosin and silicate of soda; secondly, in the production of a special Bleachers' Soap; thirdly, in an absolutely pure Caustic Soda Liquor. As this Liquor is manufactured at a price comparing favourably with 70° caustic, all users of Caustic Soda in the neighbourhood of this firm should welcome a product which combines the advantages of being as pure a caustic as 77° Caustic Soda with the cheapness of 70°. This liquor is brought as near to the solidifying point of sodium hydrate as possible, viz., 110° Tw., at which strength the liquor contains 52% of hydrate (NaOH). It is well settled at this strength, thereby becoming as free from carbonate of soda and other salts as it is ever possible to obtain in a caustic soda.

Carbonate of soda is nearly insoluble in a solution of this strength, and the strength of the liquid is therefore an absolute guarantee of its purity, requiring no testing, which, to such manufacturers who have no trained chemists or who have no time for testing this product, should be a matter of some importance. The great advantages accruing from the use of this Caustic Liquor are sufficiently conspicuous, so that we hardly need enumerate them. Small or large quantities can be used with practically no trouble. No drums need be broken. A small quantity can be used without breaking up and damaging a larger quantity. No dissolving is required. Steam and labour are unnecessary. Purity, and absolutely constant composition are ensured, which hitherto could only be said of the purest solid caustic.

The package is not destroyed, as the same drums are used over and over again, the drums forming in themselves store tanks. They can be supplied with a tap, and quantities taken out as required. There is one disadvantage, however, which we must point out, and which in some cases will outweigh all advantages enumerated, and that is the higher cost of carriage when compared with solid caustic. This is, of course, an easy matter of calculation, but it will prevent this firm from doing an export trade in this article. As an offset to this drawback, the firm have increased their plant for fusing down this liquor to solid 77% caustic.

In regard to their Silicate of Soda, the firm have, since our last article, developed a considerable trade in a solution of alkaline silicate of soda, evaporated down to 180° Tw.

This process is covered by a patent, so that they are the only firm who are able to produce this article.

Users of silicate of soda solutions find themselves compelled to choose between buying this substance in solution or in form of glass. The former exposes the packages, especially in a hot climate, to liability of leakage. It also necessitates expensive package, and entails a relatively high cost of freight. The use of glass, on the other hand, while obviating these disadvantages, requires an expensive plant for dissolving it, for it is well known that silicate of soda in the form of glass is an exceedingly difficult substance to dissolve, which can only be done by prolonged agitation with steam at high pressure.

The truth of this statement can be proved by referring to the detailed account of the process of manufacturing high grade silicate of soda which was published in the *Journal* in 1893 (No. 296, p. 37). We then gave a full description of the best method of procedure and the necessary plant for effecting the solution of the alkaline silicate. Reference to this article will emphatically confirm our point.

Messrs. Joseph Crosfield & Son's firm, we think, have hit on a lucky way out of this difficulty by preparing a silicate of soda solution which is evaporated until it is practically solid, having a specific gravity of 1.9 or 180° Tw. This substance has already been taken up by many users in hot countries, and is destined to largely supersede all other grades of silicate of soda.

AT the time when we first instituted a collection of short biographies of the more prominent men in the scientific and technical world as a feature of our Annual Special Issue, we expected that some years would prove very barren. Unfortunately, so far, this has not been the case, and the past year was no exception. The technical world has suffered both in the number and the quality of its losses, and the scientific world in quality in particular. It is not a very difficult task to make a commencement, seeing that it is little better than six months since the death of

T. H. HUXLEY,  
Ætat 70.

The Right Honourable Thomas Henry Huxley, was born at Ealing, where his father was a master in a semi-public school. His educational progress was largely the result of his own efforts, and at an early period he had made himself sufficiently familiar with German to dive deeply into Teutonic scientific literature. Of childhood anecdotes there are few, the most amusing, perhaps, being the incident in which he preached a sermon in imitation of the vicar, for the benefit, or rather delectation of his mother's servants. The whole of the regular school training that he received was obtained at his birthplace. In 1842, he entered the Charing Cross Hospital as a medical student. Mr. Wharton Jones, the eminent oculist, was at that time lecturer in physiology at Charing Cross, and from him the ardent young student received much encouragement. The extent and precision of the teacher's knowledge and the severe exactness of his method of lecturing were most impressive, and Huxley worked hard to obtain his approbation. Under his influence was published in the *Medical Gazette* of 1845, Huxley's first investigation into the minute structure of human hair, a part of the sheath of which, then described for the first time, is still known as "Huxley's layer." Having entered the naval medical service, he was appointed in 1846 to the *Victory* for hospital service at Haslar, but did not long remain in this position, for he was shortly offered by the influence of Sir John Richardson, the Arctic explorer and naturalist, the appointment of assistant surgeon on board Her Majesty's ship *Rattlesnake*, then being equipped under Captain Owen Stanley for an exploring cruise to the South Seas. This voyage afforded the young naturalist unlimited opportunities for studying marine life, of which he was not slow to avail himself. Several memoirs of first-rate importance were the result of these investigations, and on his return an effort was made on the part of several scientific men to induce the Admiralty to publish them in a suitable form, as a recognition of their merit, and to act up to the spirit of a pledge they had given to encourage officers to undertake scientific work. These negotiations were not completed when Huxley retired from the service, and thereafter his memoir on the "Oceanic Hydrozoa" was published by the Ray Society, with a characteristic preface illustrating the encouragement offered by the Admiralty to its officers to further the progress of natural history. Other results of this voyage were papers on the *Medusa*, on the anatomy of the *Cephalous Mollusca*, and on the *Radiolaria*, which secured his election to the Royal Society at the early age of twenty-six, and also gained for him the award of a Royal medal.

Space will not permit of anything like a summary of the many exciting episodes of his able championship of Darwin's theory. The following incident, however, is too good to be passed over, while it also serves as a specimen of his ability as a controversialist. The discussion of Darwin's "Origin of Species," at the British Association meeting, ultimately resolved itself into a wordy duel between Huxley and Bishop Wilberforce. In the heat of their encounter the Bishop

so far forgot himself as to press the matter to the verge of personality by asking "whether Huxley was related by his grandfather's or grandmother's side to an ape?" This called forth the rejoinder: "I asserted, and I repeat, that a man has no reason to be ashamed of having an ape for his grandfather. If there were an ancestor whom I should feel shame in recalling, it would be a *man*, a man of restless and versatile intellect, who, not content with an equivocal success in his own sphere of activity, plunges into scientific questions with which he has no real acquaintance, only to obscure them by an aimless rhetoric, and distract the attention of his hearers from the real point at issue by eloquent digressions and skilled appeals to religious prejudice." A contemporary writer observes: "The retort was so justly deserved and so inimitable in its manner, that no one who was present can ever forget the impression that it made." It was one of Huxley's most admirable characteristics that he was always ready to take up the cudgels on behalf of any cause which he believed to be right, at whatever risk of obloquy and unpopularity; thus we find him at the Geological Society in 1862 supporting Ramsay's newly advanced theory of the excavation of lake basins, when it was received with coolness or opposition by men so eminent as Lyell and Falconer. In the same spirit he carried the doctrine of evolution to its extreme logical limits, and lost no opportunity of expounding his views. His addresses on "Man's Place in Nature," and on "The Physical Basis of Life" in particular, roused a storm of discussion. Respecting the latter, he says it "was intended to contain a plain and untechnical statement of modern biological thought, accompanied by a protest from the philosophical side against what is commonly called 'materialism.' The result of my well-meant efforts I find to be that I am generally credited with having invented 'protoplasm' in the interests of 'materialism.' My unlucky lay sermon has been attacked by microscopists ignorant alike of biology and philosophy; by philosophers not very learned in either biology or microscopy; by clergymen of several denominations; and by some few writers who have taken the trouble to understand the subject."

Great as were his contributions to the progress of science, it was not these that earned for him widespread notoriety and popularity, and rendered his name a household word, so much as the ability and clearness with which he expounded the results of science for the benefit of the untechnical public. In this department it is not too much to say that he has never been surpassed, and rarely equalled. His spoken lectures were models of pellucid exposition; his intellectual perception of his subject seemed so clear that he had only to put it into words to make every point obvious to his audience; whilst his remarks were from time to time lighted up by those flashes of humour without which no popular address can be regarded as an unqualified success. The discourse to working men on "a piece of chalk" may be cited as a striking example of his powers in this direction. "Have you understood the lecture?" he asked one day of a student. "Yes, sir, all except one or two passages, when you happened to stand between me and the blackboard." "Ah, well, you see, I do my best to be clear, but I cannot be transparent," was the ready answer. As an essayist Huxley was no less conspicuous than as a lecturer, and the charm of his style would give his writings a high position in English literature, apart altogether from the interest of the topics of which they treat.

Though at times his faithful advocacy of the Darwinian theory led him into error, his mistakes were few, and compared with his marked

successes, insignificant. The motives and aims which actuated him are clearly shown by his own introductory words to his collected essays. While expressing doubts as to the worthiness of his life's work, he says, "But if I may speak of the objects I have had more or less definitely in view since I began the ascent of my hillock, they are briefly these:—To promote the increase of natural knowledge, and to forward the application of scientific methods of investigation to all the problems of life, to the best of my ability, in the conviction, which has grown with my growth, and strengthened with my strength, that there is no alleviation for the sufferings of mankind except veracity of thought and of action, and the resolute facing of the world as it is when the garment of make-believe by which pious hands have hidden its uglier features is stripped off."

Herein we obtain the key note to his actions and writings, and very little consideration will show how great his loss is, not only to the scientific world, but also the world in general, since it would be difficult to find many men who have so honestly and consistently adhered to their convictions, be they what they may. A lover of truth, he sought it ardently, and who knows but what he found it?

#### L. PASTEUR.

Ætät 73.

By the death of Louis Pasteur, on September 28th, 1895, from paralysis, at Garches, near St. Cloud, chemistry, as well as the related sciences, have lost an able exponent. It is not generally known that it was only when well advanced in life that Pasteur devoted himself to his researches on inoculation. He was born on December 22nd, 1822, at Dôle, in the Jura, where his father was a working tanner, removing at a later date to Arbois. Here his talented son began his education, passing afterwards to Besançon, where he took his bachelor's degree and joined the teaching staff of the college. He next went to Paris, and turned his attention to scientific studies at the Collège St. Louis, taking his doctor's degree in 1847. After a short period of service as professor at Dôle he was called to Strasburg, where he became ultimately professor of chemistry and physics. In 1854 he organised, as dean, the new Faculty of Sciences at Lille. For the ten years from 1857 to 1867 he had the direction of the scientific studies at the Ecole Normale Supérieure of Paris. He held the chair of chemistry at the Sorbonne from 1867 to 1875. In 1868 the University of Bonn sent him the honorary degree of doctor of medicine, but on the outbreak of the war with Germany he sent back his diploma—a course which has been variously criticised. Many other distinctions awaited him. He was a Fellow of the Royal Society, and of many other learned bodies in his own and other countries. His early researches related to the polarisation of light. To these succeeded his investigations in fermentation, with their practical applications and accompanying controversies as to spontaneous generation. He also made a special study of the diseases by which the silkworm is attacked. The practical importance of his conclusions led the French Assembly to grant M. Pasteur a pension of 12,000 francs. To a later period belong his researches on virus. The results obtained at the "Institut Pasteur" have been a matter of keen controversy, in which M. Pasteur has been vigorously attacked, and has sometimes replied with a vivacity which he afterwards regretted. Among the foreign distinctions accorded to him were the Rumford, Copley, and Albert medals from England. He was appointed "secrétaire perpétuel" of the Académie des Sciences, but he found the duties uncongenial, and held the position for two years only.

T. H. HUXLEY.

## J. L. VON MEYER.

## Ætat 65.

Julius Lothar von Meyer, was born at Varel, in the Grand Duchy of Oldenburg, being the son of a then well-known physician, Dr. August Meyer. After completing his gymnasium course at Oldenburg, he began to study medicine at Zürich in 1851. Here he spent four semesters, followed by two semesters at Würzburg, where he received the degree of Doctor of Medicine in the spring of 1854, for a thesis on the question of the condition of gaseous combinations in the blood.

Meyer's tastes now led him away from medicine, and in the direction of pure chemistry, and especially toward physical chemistry. Leaving Bunsen, he went to the old university of Königsberg, attracted by the courses of lectures given by Franz Neumann on the subject of mathematical physics. In the spring of 1858, he went to Breslau, and was given the degree of Doctor of Philosophy for a dissertation on the absorption of carbon monoxide by the blood.

In 1859, he was given the position of Director of the Chemical Laboratory of the Physiological Institute. Here he remained until 1866, publishing in the interval a number of valuable papers, and the first edition of his famous work, "Die modernen Theorien der Chemie." In some of his earlier papers Meyer began the study of the relations existing between the atomic weights and physical and chemical properties of the elements. Their relations were soon formulated in his "Periodic System of the Elements."

It is true that Mendelejeff also arrived independently at almost similar conclusions, but this fact does not diminish the value of Meyer's work since his was likewise original.

Among the honours conferred on him were the Davy Medal of the Royal Society in 1882; the honorary membership of the Chemical Society the following year. Later he was made corresponding member of the Russian and also the Prussian Academy of Sciences.

In addition to the renown he so justly won, he was also a chemist possessing great manual dexterity, being unusually skillful as a glass blower. As a lecturer he was simple and explicit, while for a teacher of such eminence he was kindly and patient to a remarkable extent. By comparison there are few investigators of equal or even minor standing, who are in these days willing to give as much time from private work as he freely gave to interested students.

## H. B. NASON.

## Ætat 64.

Henry Bradford Nason, who died in January last, was professor of chemistry and natural science at the Rensselaer Polytechnic Institute, N. Y. He was born at Foxborough, Mass. His early training was received at Newburyport, afterwards attending the Academy at Bridgewater, and finally graduating at Amherst College in 1855. He then proceeded *via* London, Holland, and Belgium, to Göttingen, where the same year he was matriculated as a student of philosophy.

While connected with the university he devoted his time to chemistry, mineralogy, and geology, and attended lectures on physics and botany, graduating in the summer of 1857. He spent a short time at Heidelberg and Freiburg, and then visited Berlin, Paris, and London. He spent the winter of 1857-58 in teaching at the Raymond Collegiate Institute, Carmel, Putnam County, N. Y. In April, 1858, he was appointed professor of natural history in the Rensselaer Polytechnic Institute. In the summer he declined an appointment as professor of chemistry and natural science in Oahu College, Hawaiian Islands. He accepted an appointment to the same chair in Beloit College, Wisconsin, in September, 1858, and spent a part of each year there, the remainder of the time at Troy, until 1866, when he resigned the position at Beloit to accept the professorship of chemistry and natural science at the institute, which position he held until his death.

In addition to a number of minor works, he translated and revised several important German works on mineral and blow-pipe analysis. Besides being a member of many American literary, scientific, and social clubs and societies, he was also a Fellow of the Chemical Society, and a member of the Society of Chemical Industry.

## G. KRÜSS.

## Ætat 35.

The death of Gerhard Krüss at such an early age was the unfortunate means of cutting short a career as full of promise as it had so far been brilliant and fruitful. His father was a well-known optician at Hamburg. At the age of twenty he went to the Munich University, studying chemistry under Boeyer and Zimmermann. Two years later he spent a summer session under Bunsen at Heidelberg.

His early acquaintance with physical instruments, particularly the spectroscope, led him to begin a series of investigations in the field of spectroscopic chemical analysis. His first paper described a spectroscopic method of ascertaining whether two coloured solutions on mixing, reacted chemically or merely mixed. In subsequent papers he proved by experimenting on the absorption bands of indigo and fluorescein and their derivatives that the substitution of methyl, oxymethyl, ethyl, or bromine for an atom of hydrogen, moved the absorption spectra towards the red, while the introduction of an nitro group or an amido group, produced just the opposite effect.

Krüss saw and clearly described the practical bearing of these discoveries, and, as a result, the spectroscope is now employed at Höchst, both for the examination of the purity of known dyes, and as a guide to the production of new ones.

His first strictly chemical researches were taken up under the able guidance of Clemens Zimmermann, at whose suggestion he undertook the investigation of the sulphur compounds of molybdenum.

After the death of Zimmermann (March, 1885) Krüss turned his attention to the study of the compounds of gold. In these investigations, which extended from 1886 to 1893, he corrected the older statements concerning the gold oxides, showing that only  $Au_2O$ ,  $Au_2O_2$ , and  $Au_2O_3$  exist, redetermined the atomic weight of the element, measured the spark spectrum given by a neutral solution of gold chloride, and, partly in connection with his students, investigated the compounds of gold with the halogens and with sulphur.

One of the greatest services that he rendered to inorganic chemistry was the founding of the *Zeitschrift für Anorganische Chemie*, which he also edited successfully. In three years it fully justified its establishment.

The latter part of Krüss's work lay chiefly in the obscure and difficult field of the rare earths, to which he first devoted attention in conjunction with Nilson in 1886, but these researches are too numerous to admit of detailed mention here. Besides critically studying the characteristics of the different "earths," he greatly developed the methods of separation and examination of these allied elements. Among the many other admirable papers which appeared, there may also be mentioned that with Morahut upon glucinum, with Ohnmais upon the sulpho-salts of vanadium, and with Thiele upon the condition of iodine in solution and the probable cause of the differences in colour of its solutions.

## H. D. POCHIN.

## Ætat 71.

The name of H. D. Pochin is one that will need no introduction to the chemical trade, from which, by his death on October 28, 1895, at Bodnant Hall, near Bettys-y-Coed, an interesting and long-known member has been removed.

Mr. Pochin was a native of Leicester, and on leaving school was apprenticed to a local chemist and druggist. Subsequently settling in Manchester, he took a position in the establishment of Mr. James Woolley (now James Woolley, Sons, and Co.). On the failure in health of Mr. Halliday, of the firm of Halliday and Co. (in which Mr. Woolley was a partner), chemical manufacturers, Quay-street, Salford, Mr. Pochin became the manager of the works, afterwards conducted under the firm of Pochin and Woolley. As the result of his discovery of the decomposition of China clay by sulphuric acid, which was patented, they entered on the manufacture of aluminous cake on an extensive scale at Newton Heath. Shortly after the passing of the Limited Liability Act of 1855, Mr. David Chadwick, with Mr. Pochin and other friends, formed a syndicate for the conversion of several large concerns from private ownership into public companies. The

transaction proved highly remunerative, and Mr. Pochin rapidly realised a fortune.

Another important process he worked out was the purification of resin by means of distillation. Before he set to work on the task it was believed that resin could not be distilled without decomposition, but he found that if it was heated to 400° F., and steam was blown through it, it would distil undecomposed and free from colour. Resin refined by this process is now very largely used in the manufacture of pale yellow soaps, and is the foundation of almost all fancy soaps. Pochin is said to have sold his patent to a large soap manufacturer for about £50,000. He was deputy chairman of Bolckow, Vaughan, and Co., Ltd., of John Brown and Co., Ltd., and of the Metropolitan Railway.

For several years Mr. Pochin lived at Barn Elms, Surrey, but about 1880 he bought an estate on the river Conway, and there built his house of Bodnant Hall, where he continued to live up to the time of his death.

#### J. LEATHART.

*Ætat 75.*

The death of James Leathart, took place on the 9th August, 1895, at his residence, Bracken Dene, Saltwell, Gateshead-on-Tyne. The deceased gentleman, who was the son of Mr. John Leathart, mining engineer, Alston, was born on the 25th November, 1820.

In 1836 he came to Newcastle, and joined the firm of Locke, Blackett, and Co., lead manufacturers. He soon became managing partner of this firm, and under his direction, Locke, Blackett, and Co. greatly extended both their business and their works, by erecting large smelting and desilverizing works at St. Anthony's, in 1865, in addition to their white, red, and sheet lead works.

On the conversion of the firm into a limited liability company in 1891, Mr. Leathart became managing director, retaining this position until his death. He was also a director of the Tyne Steam Shipping Co., Ltd., and of Wm. Cleland and Co., Ltd.

Several years ago he was appointed a justice of the peace for Gateshead, and afterwards he took a seat on the bench for the county of Durham.

He had a strong love of art, and for many years he was on terms of intimate friendship with many of the pre-Raphaelite Brotherhood. He possessed one of the finest collections of paintings in the North, containing well-known examples from the brush of Dante Gabriel Rossetti, Ford Madox Brown, Sir E. Burne Jones, Wm. Holman Hunt, Albert Moore, Arthur Hughes, Wm. Davis, Mark Anthony, W. B. Scott, etc.

#### W. C. DEELEY.

*Ætat 61.*

The death of William Clarke Deely, on the 4th June last, came as a surprise to most of those who knew him, as he was a man of robust frame, who being laid up by an attack of pneumonia, despite a rally, suddenly succumbed to a relapse. He was a native of Warwickshire, and went to Chester from Liverpool in 1869, to take over a small concern, known as the Dee Mineral Oil Co. Prior to this he had managed the copper works at Padeswood, Flintshire. At the Dee Mineral Oil Co. he was subsequently joined by Mr. Chas. Homfrey, and later on by Mr. John Thompson about the year 1873, the company being known as the Dee Oil Co., Saltney. The concern was converted some five years ago into a limited liability company, with Mr. Deeley as manager, but his connection with it terminated two years or so prior to his death.

He was an ardent member of the Town Council, at the meetings of which his fearlessness and acuteness, and his technical knowledge and varied experience gave him a commanding position in debate.

#### H. FLETCHER.

*Ætat 53.*

Herbert Fletcher was born at Bolton, April 25, 1842, and educated at Windermere Grammar School. He studied mechanical engineering with Messrs. Hick, Hargraves and Co., at Soho Works, Bolton, and surveying under Mr. Ellis Dorning, of Manchester. Later he managed the Clifton and Kearsley Collieries, near Manchester, for his father (he late Mr. John Fletcher, D.L.), and was owner of the Ladyshore

Colliery, near Bolton. For a time he acted as consulting engineer to the Atherton Collieries, near Bolton, and up to his death was mineral adviser to the Duke of Buccleuch at Burnley. Besides designing many practical improvements in small appliances for coal pits, he adopted the method now used at Ladyshore Colliery of filling up the goaf, as the coal was extracted, with material from all parts of the mines, instead of sending the latter to bank; and brought down the pit for that purpose cinders and other available refuse. In this way the weight is taken as it comes on, avoiding falls at the face, better than by props and chocks, and still better to leaving no space for the accumulation of gas. For the last 15 years of his life he worked hard to abate the nuisance of smoke arising from boiler fires. He adopted a mechanical furnace of the coking type, and for many years his chimneys have been practically smokeless, while steam has been raised with the maximum of economy from the colliery refuse, for which no reasonable price could be obtained. In these furnaces he made many improvements. During the last few years he devoted his whole interest and energy to the general question of smoke abatement, and spent much time in collecting information for a report to the Smoke Abatement Society, with the object of showing conclusively the merits of the different methods of boiler firing, and proving that the mechanical furnace was the most economical in utilisation of both fuel and boiler space, and that the furnace which made the least smoke was financially the most economical. For nearly ten years he was a member of the Bolton Town Council, and was also a member of the Lancashire County Council. His death occurred suddenly at his colliery near Bolton, from failure of the heart, on September 16th, 1895. He was well known throughout Lancashire, and his death will be regretted by all engaged in the solution of the vexed question of smoke prevention. As a member of the Sanitary Association he never lost an opportunity of urging his views on the smoke question. During the great coal dispute Mr. Fletcher was one of the few employers who conceded the demands of the Federation, and commenced working his pits some time before the dispute was settled.

#### R. BELL.

*Ætat 71.*

Robert Bell was born at Wishaw on December 4, 1824. He developed into a man of energy and enterprise, and first met success as a coalmaster. In 1851 he leased a coalfield on the Wishaw estate of Lord Belhaven, and later he took other fields on the same estate, and before long became one of the leading coalmasters of the district. In 1860 he erected the Wishaw blast furnaces, and worked them for some time; but this undertaking ended in failure, and the plant was eventually sold to the Glasgow Iron Company. He had brick works going in Wishaw for many years, and also steel nail works. In 1866 he purchased the estate of Glen Helens, in the Isle of Man, and on it he opened slate quarries. In 1879 he commenced to work canal coal and limestone mines in the parish of Muirkirk; in 1885 he took a leading part in starting the Belhaven Iron and Steel Works, Wishaw; and in 1887 he opened quarries for building stone near Linlithgow. He was a shrew business man; but, having a very sanguine temperament, he sometimes launched out into undertakings from which he got no personal recompense. He was best known, however, in connection with the shale and paraffin oil industry. In 1858 Mr. Bell had taken a lease of the minerals on the Earl of Buchan's estate at Broxburn, parish of Uphall. He tried ironstone mining, but it did not succeed; and he from several pits supplied the neighbourhood with household coal, working the Houston seam at the very bottom of the coal measures. When the Boghead coal became exhausted, the shale was tried, and, although it gave only 30 gallons per ton, while the Boghead coal gave 100 to 120 gallons, its distillation was persevered in, with the result that Dr. Steel, Mr. Poynter, Mr. Fernie, and several others started works at Broxburn, getting shale from Mr. Bell. The Broxburn Oil Company, Limited, was floated in 1878, and took over Mr. Bell's lease of the minerals. Mr. Bell was always a director, and was for a long time chairman, taking an active interest in all that was done, though the management was shared with other first-rate men. The company was successful beyond all expectation, and Mr. Bell commenced to reap the just reward of his energy.

## Laboratory Hints and Appliances.

### CRAIG'S COMBUSTION TESTER.

LAST year in these columns we described an ingenious combustion tester based on physical principles, the agency for which, by the bye, is in the hands of Messrs. Meldrum Bros., of City-road, Manchester. The tester to which we now draw attention is based on the principle of chemical absorption. It is the patented invention of Mr. Geo. Craig, of Lugar Iron Works, Cammock, N.B., and is being introduced by Messrs. Baird and Tatlock, of 40, Renfrew-street, Glasgow (and London).

When any combustible is burned with the lowest possible excess of air, its maximum calorific intensity is obtained; and the "Combustion Tester" has been designed to ascertain the accomplishment of this object. It is simply an almost automatic apparatus that, with the minimum of trouble, indicates the percentage of carbonic acid in flue, chimney, or other gases in a few minutes. The greater the proportion of carbonic acid obtained, the more perfectly is the fuel or gas being burned.

Another field in which the instrument is of peculiar value is for regulating gas producers. The gas from these should contain as little carbonic acid as possible, and the apparatus indicates at once if the producers are being properly and economically worked. In iron and steel works, mills, and gas works, and for coke ovens, chemical works, engineering works, and ocean steamships the apparatus is simply invaluable, and large fuel economies may be effected by its use.

It is strongly made, and so simple as to require no skilled attention; the fireman or attendant can easily work it, and learn at any time how matters stand.

#### DIRECTIONS FOR USE.

(1.) The apparatus should be fixed as near the flue as is convenient and carefully levelled. At the same time it is advisable that the pipe connecting with the flue should be about ten feet long so as to thoroughly cool the gases prior to their entering the apparatus. (2.) The measuring compartments are filled with paraffin oil, or petroleum, through the plugs A and A' until overflowing at the side taps B and B'. (3.) The central chamber is filled with the "absorbent mixture" by the opening C, until within one inch from the top when levelled. (4.) C' serves to empty this chamber when it requires

refilling with fresh "absorbent mixture," which is known by the apparatus failing to record properly. (5.) All the openings should be tightly closed with their caps or plugs, using a little vaseline on the joints. (6.) The aspirator tank D is filled with cold water by unscrewing the cover E, connection being made thereafter with the stopcock O, as in figure. (7.) The stopcocks, J, K, L, and O, are opened, and a current of air is drawn through the apparatus by allowing a sufficient stream of water to run off by the stopcock F. The index hands revolve, and these are made to nearly synchronize by adding small quantities of paraffin oil to whichever side is going the slower, by means of the plugs A and A'. (8.) It is not worth while making them synchronize exactly, but it is essential to ascertain the exact relationship between the two recording meters. This is done by shutting the stopcock O when No. 1 hand arrives exactly at 100, putting the movable hand of No. 2 also at 100, and making, say, five complete revolutions of No. 1. No. 2 hand will have gone either more or less and, whatever it is, when divided by the number of revolutions, gives the *difference per revolution*. This requires to be subtracted from the carbonic acid found subsequently if No. 2 goes the slower, or added if No. 2 goes the faster.

#### DETERMINATION OF CARBONIC ACID.

The aspirator is set to work, and a few revolutions made to clear out the air in the apparatus. The stopcock O is shut when No. 1 hand is exactly at 100, and No. 2 hand is brought to 100 also. The stopcock O is then gently opened, and closed when No. 1 hand has made a complete revolution, which should occupy from two to three minutes; the position of No. 2 hand then indicates the percentage of carbonic acid in the gases.

#### CARBONIC ACID IN FLUE GASES.

The possible maximum of carbonic acid in flue gases when anthracitic or bituminous coal is being burned varies from 19 per cent. to 20 per cent., and is but little different for producer gas. Such proportions are never obtained in practice unless with coke ovens, in which the tightness of the building (a point of paramount importance) helps the result. With 10 per cent. only, it means that more than twice the amount of air necessary for combustion is being used, or that so much coal is being burned to heat up a lot of air that simply escapes by the chimney, hurting the draught at the same time. With producer and furnace gases 16 per cent. is easily obtained.

No hard-and-fast figures can be laid down, but such results ought to be striven for, and the settings repaired or pointed if necessary.

## A HANDY LABORATORY STILL.

The still illustrated below can be heated either by fire or gas, or directly by waste steam. The latter pattern is shown in Figs. 1 and 2. The idea has been made the subject of a patent by Messrs. Morris and Wethered. The apparatus consists of a pan or still A, enclosed by a steam-jacket B. The top of the still is closed by a cone, as shown, there being a channel G left between it and the top of the pan. Any liquid condensing in the cone trickles down into this channel, instead of falling back into the pan. This channel, it will be seen, is in communication with an inclined delivery pipe H, fitted with baffle-plates, as shown in Fig. 2. These baffle-plates retard the flow, and give time

Fig. 2. Sec<sup>n</sup> on line X.Y. also showing Sec<sup>n</sup> of cooling chamber.

for the heat to be abstracted by the water circulating in the jacket K (Fig. 1). This jacket is divided into two parts connected by the pipe L, one part surrounding the delivery pipe and the other the top of the cone above the still. An outlet regulated by a suitable tap is provided at N. The still is provided with an automatic feeding device. It consists of a down pipe O, supported on a cage S. Inside this cage is a float R, on the top of which is a valve P, which, as the float rises,

closes the outlet from the down pipe. The output is said to be about six times that of ordinary stills, though only occupying one half the usual space. The still is being made by Messrs. Llewellyn and James, of Bristol, who are now making a special cheap still, producing  $5\frac{1}{2}$  pints per hour, for Laboratories, &c. The method of working is as follows:—Fix a rubber hose to the water inlet J (Fig. 1) from a water main or tank. On N connect a hose for outlet of waste water. Then

turn on regulating cock M and supply cock J. Open the manhole of still body and watch the rise of water until it reaches to the centre of

Fig. 1. Sec<sup>n</sup> thro' centre of still.

float inside the still. Turn off both cocks M and J and turn on steam, or light gas or fire as required. As soon as the water boils turn regulating cock M about one half turn; then regulate the inlet water at cock J to about one third turn. When distilling essences, the automatic feed can be at once turned off by the cock M.

## A PORTABLE BENZOLINE FURNACE.

The principle on which these furnaces are constructed is the continuous automatic distillation of benzoline under any desired pressure from 5 lbs. to the square inch upwards, the blast being unaffected by the

pressure. The furnace is independent of bellows, blower, pumps, or chimney. These advantages, combined with its economy and power, render it highly useful to metallurgists, chemists, and those requiring a portable but powerful source of heat, free from dust and smoke. The fuel is secured in strong steel cylinders, the tubes being of solid drawn copper. The furnace can be obtained in three sizes, from the makers, Messrs. Nelson and Sons, Sherland Works, Twickenham, London, S.W.

### KUHLMANN'S BALANCE MIRROR INDICATOR.

Acting upon a suggestion thrown out by Prof. Ladenburg, Herr Kuhlmann has constructed a quick reading balance, in which the fractions of milligrammes are indicated by the deflection of the pointer from the vertical. These balances have the centre of gravity very low, and are consequently equally sensitive under every weight, and the oscillations are more constant. They are so adjusted that the balance is turned  $2^\circ$  by an overweight of 1 mg., and the pointer is moved 2 mm. on the scale. These 2 mm. are divided into 10 parts, and are observed through a small telescope, so that, assisted by its magnifying power, the deci-mgs. are readily read off, and centi-mgs. can be approximately judged. The telescope is fixed outside the case to the front frame, and is easily removable. The increased speed with which an exact weighing can be taken by an instrument of this construction will be appreciated. The balance makes the double oscillation in 6 to 12 seconds according to the weight it carries, no weights below decigrammes are used; the rider gives centigs. and milligs., and the decimilligs. are read off the scale by the oscillation of the pointer.

In our illustration, however, we show a still more simple contrivance, by means of which the decimilligrammes are read, the efficiency of which can be tested by actual trial at Messrs. F. Jackson and Company's showrooms, Manchester, where telescopic and mirror reading balances, as well as Kuhlmann's other precision balances can be seen.

A concave cylindrical mirror is attached to the central pillar of the balance, so that it can be moved in all directions, reflecting the scale, which is engraved on the back of the ivory plate. The pointer swings behind, but close to the latter, and to avoid seeing the same and its reflection it is split lengthways above the end, and the two halves are bent to a rectangular frame ending in a fine point. By observing the reflection of the scale, the fine point appears to pass rapidly over the divisions, and the degrees of the oscillation are easily counted.

This arrangement has great advantages over the Telescope reading, in so far as it is more convenient and does not require so strong an illumination. The pointer is protected by the scale plate, and the front slide of the balance is relieved of the telescope.

### A UNIVERSAL HAND-CLAMP.

From personal experience we are as a rule inclined to think that the handiest clamp for test tubes and light flasks, needing intermittent heating, is no clamp at all—or in other words the fingers pure and simple. Spring clips are always either too strong or too weak, while those depending on the fingers for pressure are more cramping than the humble but efficient band of folded paper. Our illustration, however, shows a fairly satisfactory combination of the requisite attributes,

of a successful universal hand-clamp. It has been devised by Dr. Austen and Mr. W. A. Horton of the Brooklyn Polytechnic Institute, New York, and is made by Messrs. Ermei and Amend of that city. The clutch B slides on the parallel bars E, and is slightly smaller than the counter-clutch A. This, with its curvature, allows it to grasp any object, no matter how small, that is placed between B and A. A double bearing, to insure ease of movement, is effected by winding the wire at D. The rubber strap F brings the travelling clutch back and opens the clamp as soon as the pressure is removed from C.

To use the apparatus, the handle is securely grasped, and the end of the thumb is placed against C. On straightening the thumb, in the manner of a knee-joint, the object is tightly held between the clutches. The hand does not tire on continued holding, because the pressure is taken in straight line on the bones of the thumb, and hence calls for so slight a muscular action as to be practically inappreciable.

### THE WEISS CONSISTIMETER.

In a sense this apparatus is a very delicate viscosimeter, but is applicable to the determination of the consistency of a wider range of materials than the customary types of viscosimeters. The principle can be gathered from the sectional diagram, while the other cut repre-

sents the machine in the more convenient form, made for Dr. Weiss by Herrn, Sommer, and Runge, 122, Wilhelmstrasse, Berlin, S.W. The round shallow metal vessel A contains 150c.c. when filled to the dotted line; a is a disc fixed to the vertical shaft, which works in bearings at b and c, and carries a pulley e, being rotated by means of the cord e¹

and the weights D and D¹. The number of rotations the disc makes in a given time, and with a constant power, depends upon the friction between the disc and the liquid being tested. From the number so obtained the composition of the liquid is readily found by a simple formula. Special tables are prepared for various materials. It is particularly suited to the examination of gum and sugar solutions, milk, mixtures of alcohol, water, beer, wine, fats, and oils.

## WATER PURIFICATION AND SOFTENING.

THE number of processes that are brought out for purifying or softening water is so great as to be almost overwhelming. To attempt to deal with all of them would be something closely akin to folly, as the majority prove to be distinctly ephemeral. With those that stand the test of time, forcing their way into prominence, it is a different matter, and it is incumbent upon us that we should accord to such processes the careful investigation they have merited. In the case of the Archbutt-Deeley process, which is now some five years old, we started upon the initial stages of investigation in November last. We then stated (*C.T.J.*, 443, p. 304) that the process clearly showed itself to be one that was worthy of further and more detailed description, and announced our intention of preparing the present article for this Special Issue. Before proceeding, we should here acknowledge our indebtedness to Mr. L. Archbutt, the inventor, for the special analytical data which he supplied at our request, and to Messrs. Mather and Platt, of the Salford Iron Works, Manchester, for their courtesy in affording us all the information we required concerning the plant. The process is applicable not only to the purification and softening of boiler waters, but also to the treatment of works' effluents. The outline of the latter method of treatment, as given in our issue of November 16th, 1895, needs very little filling in, and as the process presents several interesting and characteristic features when used for softening, we purpose in this article to practically confine ourselves to this—the original—application of the plant and process.

### THE PLANT

is simple, and a good idea of the general arrangement will be gathered from Figs. 1 and 2, which show a plant for treating 8,000 gallons per hour, and which we have ourselves seen in successful operation. From these illustrations the construction of the tanks will be seen, the small dissolving tanks for the preparation of the chemical precipitants, the injector pump attached to the same, and the scales for weighing off the chemicals also being shown. For 3,000 gallons per hour, and less, one softening tank is sufficient if storage is provided. For more than 10,000 gallons per hour, three or four tanks are desirable. A better idea of the details of the plant will be obtained from the sectional elevation and plan shown in Fig. 3. The chief point to be noted is the disposition of the dual service of pipes and their perfora-

tions. A glance at the two diagrams will show that the pipes are situated directly under one another, at different levels, thus constituting an upper and lower range of pipes, perforated respectively on their *upper* and *under* sides. To save repetition it is desirable to refer to the other details one by one as may be necessary in describing

### THE PROCESS.

While the tank is filling, quicklime and sodium carbonate (58% ammonia-alkali), in proportions which depend upon the character of the water, are weighed out, and tipped into the small chemical tank F. The lime is first slaked and then boiled by means of the perforated steam coil shown in the elevation, to form a milk of lime, after which the alkali is added and stirred until dissolved. Some waters require also the addition of a little aluminoferric (for which occasionally copperas is substituted). This is conveniently prepared in the form of a standard solution, of which a measured volume is added to each tank of water immediately after the chemicals have been run in. When the tank is full, and the inlet valve A has been closed, steam from the boiler is admitted to the blower B, causing a current of water to circulate up through the rose R, the three-way cock C, down the right-hand vertical pipe P, and back into the tank through the perforations in the *upper* row of horizontal pipes. On opening the small tap T, the prepared chemical solution is slowly drawn into the circulating current, and thus diffused throughout the body of water in the tank.

*Accelerating the Precipitation.*—This is one of the main features of the process. When the thorough intermingling of the chemicals has been effected, and the tap T has been closed, the cock D is opened to admit air through the pipe at the top of the blower, and by reversing the three-way cock C this air is forced down the left-hand pipe and through the perforations on the under

side of the *lower* row of pipes. From these it rises in streams of bubbles, stirring up some of the precipitate or mud from previous operations which lies on the bottom of the tank. Before being mixed with this mud, the new precipitate, which is very finely divided, will not coagulate, and takes a long time to settle; but when the old precipitate, consisting of coarse particles, is stirred up, the fine particles attach themselves to the coarse particles, and the subsidence of the precipitate is thereby greatly accelerated when the water is allowed to rest. Many theories can be advanced for the explanation of this fact, some of which

FIG. 3.

then selling at over £6. per ton as compared with £3. 7s. 6d. to-day. The practical working of the last four years has shown that the united cost of chemicals and labour amounts to rather less than 1d. per 1,000 gallons. The question of the removal of organic impurity should also be mentioned in passing. Very few of the waters used for boiler feeding purposes are wholly free from sewage, so that it is interesting to know that the Derwent water, showing 0.42 parts per million of albuminoid ammonia, gave, after treatment and 30 minutes subsidence, 0.28 parts per million. The absorbed oxygen was also nearly halved. To those troubled with bad and hard boiler water the interest of the foregoing will be greatly enhanced by the following figures, which show the results that have been attained with various waters in different localities, thus enabling a rough estimate of probable efficiency to be made for individual cases:—

## NO. I.

*River Derwent, at Derby, variable water, an average analysis gave:*

| Grains per Gallon.      |            |
|-------------------------|------------|
| CaCO <sub>3</sub> ..... | 8.86       |
| CaSO <sub>4</sub> ..... | 2.31       |
| MgCO <sub>3</sub> ..... | .69        |
| MgSO <sub>4</sub> ..... | 3.25       |
| MgCl <sub>2</sub> ..... | .26        |
| NaCl .....              | 2.00       |
| SiO <sub>2</sub> .....  | .25        |
| Organic matter          | 2.88       |
| Combined water          |            |
|                         | 20.50      |
| Hardness .....          | 14.34 deg. |

This water softened by adding a sufficiency of lime and 18 lb. of sodium carbonate (58% alkali) to 20,000 gallons has an average soap hardness of 4 deg.

Some of the water softened with lime and 24 lbs. of alkali to the tank of 20,000 gallons gave the following results on analysis:—

| Grains per Gallon.                    |                      |
|---------------------------------------|----------------------|
| CaCO <sub>3</sub> .....               | 1.46 = CaO 0.82 grs. |
| MgCO <sub>3</sub> .....               | 1.38 = MgO 0.66 "    |
| Na <sub>2</sub> CO <sub>3</sub> ..... | 5.43                 |
| Na <sub>2</sub> SO <sub>4</sub> ..... | 5.40                 |
| NaCl .....                            | 3.05                 |
| SiO <sub>2</sub> .....                | .44                  |
| Organic matter                        | 1.34                 |
| Combined water                        |                      |
|                                       | 18.50                |
| Hardness .....                        | 3.1 deg.             |

## NO. II.

*Well at Radford, Nottingham, 4,000 gallons per hour treated:—*

| Grains per Gallon.                      |            |
|-----------------------------------------|------------|
| CaCO <sub>3</sub> .....                 | 9.19       |
| CaSO <sub>4</sub> .....                 | 12.17      |
| MgCO <sub>3</sub> .....                 | 1.40       |
| MgSO <sub>4</sub> .....                 | 7.05       |
| Mg(NO <sub>3</sub> ) <sub>2</sub> ..... | 13.69      |
| MgCl <sub>2</sub> .....                 | .64        |
| NaCl .....                              | 6.30       |
| SiO <sub>2</sub> .....                  | .62        |
|                                         | 51.06      |
| Hardness .....                          | 35.53 deg. |

This water is softened by adding 25 lbs. of lime and 34 lbs. of sodium carbonate (58% alkali) to 9,000 gallons, and after treatment has

an average soap hardness of 3.2 deg. Analysis of the softened water on different dates gave the following results:—

|                | Grains per Gallon. |            |             |
|----------------|--------------------|------------|-------------|
|                | Oct., 1892.        | May, 1893. | Nov., 1893. |
| CaO .....      | 1.29               | 1.06       | 1.48        |
| MgO .....      | 1.42               | 0.19       | 0.68        |
| Hardness ..... | 5.82               | 2.36       | 4.33        |

## NO. III.

*Well at Adlington, Lancashire, treating 8,000 gallons per hour in plant illustrated; somewhat variable water. Two analyses gave:—*

|                                       | Grains per Gallon. |             |
|---------------------------------------|--------------------|-------------|
|                                       | Jan., 1894.        | Jan., 1895. |
| CaCO <sub>3</sub> .....               | 10.98              | 10.00       |
| MgCO <sub>3</sub> .....               | 4.56               | 4.76        |
| MgSO <sub>4</sub> .....               | 1.38               | —           |
| Na <sub>2</sub> CO <sub>3</sub> ..... | —                  | 4.19        |
| Na <sub>2</sub> SO <sub>4</sub> ..... | 3.41               | 4.15        |
| NaCl .....                            | 2.29               | 1.65        |
|                                       | 22.62              | 24.75       |
| CaO .....                             | 6.15               | 5.60        |
| MgO .....                             | 2.63               | 2.28        |
| Hardness .....                        | 17.50 deg.         | 15.65 deg.  |

This water is softened by adding about 35 lbs. of lime and 3 lbs. of sodium carbonate (58% alkali) to 14,000 gallons, and the hardness is reduced to about 3—3½ deg. An analysis made in December, 1894, showed:—

|                |                         |
|----------------|-------------------------|
| CaO .....      | 0.56 grains per gallon. |
| MgO .....      | 0.70 " " "              |
| Hardness ..... | 2.74 deg.               |

Such are results obtained with three widely different waters, for it will be noticed that the magnesia in Nos. II. and III. is considerable, though the hardness of No. 3 approximates that of No. 1. If further testimony is wanting it can be found, we think, in the fact that at the present time this softening process is being used successfully by bleachers, papermakers, chemical manufacturers, sugar refiners, and in laundries, treating in all 100,600 gallons per hour from day to day.

## FOR TREATING EFFLUENTS.

As applied to works' effluents there are 304,000 gallons per hour now being treated at different works. The process is just the same as described above, save that the carbonation is omitted, and the precipitant is varied to suit the requirements of the various trade effluents. The usual bugbear—the large space required for settling tanks—is obviated. At the same time, in addition to the advantage of speedy settling in a small area, the process is under absolute control, so that should the effluent, owing to exceptional circumstances, be under-treated, the error can at once be remedied and a perfectly satisfactory effluent passed out of the works. This is, we believe, an unique feature, and one that must commend itself to those who have experienced the difficulties of always satisfying the inspectors when working with a variable waste water in ordinary flow-through tanks.

## A SIMPLE SACK-HOLDER.

TILL the difficulties of trying to fill a sack single-handed have been ascertained by an actual trial, the full advantages of the simple contrivance we illustrate will probably not be adequately appreciated.

Those who have had to do with sack filling in the course of their businesses will, however, at once see the utility of this handy, labour-saving holder. By its use the work that formerly required a man and a lad can be as speedily accomplished by the man alone. Although so useful, they are nevertheless very cheap, and the saving in time and in labour will soon repay the initial outlay. The invention is one that we strongly commend to the notice of the many chemical trades in which it will be found useful, and to cement, manure, and sulphate of ammonia makers in particular.

The makers are Messrs. J. McDowall and Co., 230, Berkley street, Glasgow, from whom all particulars can be obtained.

### THE USE AND ABUSE OF RESPIRATORS.

THERE is little need to say much about the use of respirators if, as in the case of this article, we confine our consideration to industrial hygiene. But when we come to the question of utility and suitability there is much more to be said, since, as yet, we seem to be a considerable distance from perfection. A great deal depends on the form, as the wearers are very sensitive about their looks, and more so in regard to the mild banter that they have to suffer from those who are fortunate enough to have no need to wear anything of the kind. The reason for this delicate persecution cannot be argued out here, but it is characteristic of the astonishing inconsistency of the working classes, who clamour for protection and yet make laughing-stocks of those of their fellow-operatives who are sensible enough to make use of the facilities provided for their self-protection. In this article we shall exclude those forms designed for use with absolutely irrespirable gases, such as chlorine or carbon dioxide, etc., since for the former the flannel binder is now accepted by the Government to be efficient, while for the latter Kleemann's air-fed helmet is specially applicable, though for an every-day working appliance it would be useless.

series of comparative trials with the other forms are necessary to ascertain the relative filtering efficiencies, and tendencies to clog, thereby increasing the difficulty of respiration. The black respirator has no special advantage save that of lightness, which it shares with the linen nose-bag. On the other hand, it is generally objected to on account of the difficulty of breathing through it for any length of time. The third form has a flexible head that fits almost air-tight on the face. It is provided with outlet valves, which allow the breath as exhaled to escape, without permitting the entrance of unfiltered air. The filtering medium can be quickly removed, and fresh substituted, while, if necessary, it can be impregnated with an antidote. Its weight is sometimes a source of complaint, though it is not excessive. It is largely used in white-lead works, where it appears to give general satisfaction.

To the employer the respirator question is a troublesome one. It is remarkable how these respirators lose themselves, and constantly want replacing. In some works they have been known to be used as an extemporised football, particularly in the case of rubber ones. We know of one firm that provided separate lock-up cupboards so that each operative had his own muzzle to wear, and, after providing two

The three forms most generally employed in works and mills are shown in the accompanying illustration, in the production of which we are indebted to Messrs. Kerr and Hoegger, of Newton Heath, Manchester, for their co-operation and assistance. The calico bag arrangement is the latest recommendation of the Government, and, strange to say, finds favour with a certain class of operatives. It is generally fitted at the mouth with wire, which can be bent to fit the contour of the features. It is difficult to see any great advantage about the contrivance, and it certainly presents a serious disadvantage in necessitating the escape of the exhaled air through the same medium which has to filter the air breathed. This is not suggestive of great efficiency. The operatives seem to like it because it is the easiest to breathe through, a statement which strengthens our last remark somewhat. Another factor in its popularity is, we fear, the ease with which it can be slipped under the chin or round the neck, and yet quickly replaced the moment there is danger of a reprimand for such negligence. Before final judgment is passed on this form, we think a

different forms, has now had to supply the linen nose-bag to ensure anything like regular use. When the wearers are so whimsical it is no wonder some firms are not as strict as they might be on this point. The question of universal efficiency has yet to be settled, and until this has been done the numberless complaints and excuses made by those who have to wear them cannot be definitely disposed of.

**MANGANESE PEROXIDE.**—The uses of this well-known oxide are manifold. Potters use it for colouring glass and enamels, and varnish makers for the preparation of quick drying varnishes. It is also especially serviceable as a drier for oils, with the exception of one drawback, and that is the tendency which this oxide has to darken the oils. It appears that Herr J. Pannenberg, of Arnstadt, Thüringen, is now offering a special peroxide of manganese with which decidedly pale oils can be obtained, and it should therefore be favourably received by oil boilers. Herr Pannenberg also supplies all kinds of pottery and other minerals, such as spars, chrome ores, magnesite, and barytes.

### ABOUT ASBESTOS.

IT would seem as if there was no limit to the industrial applications of asbestos. It would not be an easy task to compile a list of *all* its uses at the present moment, and yet hardly a year passes without bringing with it additional outlets for the utility of this important mineral. In the technical press these are, in one way or another, duly chronicled, so that in a general way the busiest of busy men get to know about its uses; but, as a rule, they do not know much about the mining and preparation of asbestos. In this article, therefore, we

An Italian Asbestos Mine.

purpose relating and recording some of the more interesting particulars concerning the

#### MINING OF ASBESTOS,

leaving the details of preparing for another series of articles which, we trust, will appear in our columns in the course of this year.

Asbestos is a very widely distributed mineral, occurring in some fifteen different countries situated in both the Eastern and Western Hemispheres. Many of the deposits, however, are of poor quality. Of the poorer qualities, the asbestos found in South Africa and Russia is the best. The chief sources for commercial purposes, however, are Italy and Canada, to which centres attention will be chiefly paid.

Practically, the history of Italian asbestos dates back to the beginning of this century, when native enterprise produced a kind of cloth. It was not, however, till 1866, when Signor Albonico, in conjunction with a Florentine cleric and the Marquis di Baviera, obtained concessions, and set about producing cloth and paper, that asbestos began to acquire its claims to commercial importance, as well as purely scientific interest. Its development was unfortunately prematurely arrested in 1870 by the Franco-German war. The mines afterwards passed into other hands, and proved some of the richest in the world, one piece of nearly  $3\frac{1}{2}$  cwt. having been obtained from the mines of the United Asbestos Company in the vicinity. This rich district is situated in Lombardy, and is known as the Valtellina. It is divided into five communes, and the asbestos properties have an area of some 25,000 acres, or nearly 40 square miles. The height above sea-level of the mines hitherto opened out varies from 3,600 feet to 7,200 feet. The climate is, for such an elevation, comparatively mild, there being some places at a height of 6,000 feet where work can be carried on during the whole year. A large proportion of the population, which numbers about 5,000, is engaged in mining the mineral, the specimen shown in the illustration having been obtained from one of Signor Albonico's original mines, now owned by the United Asbestos Co.

Another district, of much the same importance, from which asbestos of commercial value is largely obtained by the United Asbestos Company is the Valley of Susa, which is reached from France *via* the Mont Cenis tunnel.

On emerging from the tunnel on the Italian side, the line follows the southern mountain slope, with a gradual descent, overlooking the town of Susa, standing at the head of the plain, which at times widening, and at times narrowing, for a distance of about 40 miles, finally opens out on the great plain of Piedmont. At a point in the centre of the valley, and on the northern mountain slope, are the places from which the floss asbestos fibre, the appearance of which in gas stoves is familiar to us all, is obtained. In the same locality is also found a fine white powder of asbestos, used in asbestos paint, and for other purposes. The ground from which these materials are got is about ten square miles in extent, and the works are carried on at a height of from 6,000 to 10,000 feet above sea level. The temperature is, of course, low at such an elevation, but the inhabitants are hardy and robust, and make willing miners. The works are reached by mule-paths for some distance, but the remainder of the way has to be done on foot, and from four to five hours are required for the journey from the plain, on which are the railway and high road. The first work done here in recent times dates from 1876. The mode in which the material is brought down the mountain side is by loading it on a sort of toboggan or sledge, which slides as easily over the rocks as over snow, and so expert are the inhabitants at this work that two men can bring down eight hundredweight of asbestos in three hours.

The third district of importance is the Aosta valley, commencing at Ivrea, a town of some importance, about 40 miles, in a nearly northern direction, from Turin. From Ivrea to Chatillon, a distance of a little under 30 miles, the railway passes through the heart of the asbestos properties which flank it on either side. The development of this district was indirectly due to the enterprise of Signor Albonico, for a certain Signor Antonio Re, of Rome, who had used the valley as a hiding-place during political troubles, heard of what was being done in

Specimen of Crude Italian Asbestos.

Lombardy, and determined to set to work on the mineral which he knew to exist in the valley. Up to this time the mineral found in this district had been thought to be of inferior quality, and not serviceable for any industrial purpose, so that no trouble was taken about it. In 1873, however, Signor Re undertook a search for some better qualities, and having assured himself that such could be found in abundance, he put himself in communication with the operators in Lombardy, and they, being satisfied with the material, started working on a pretty large scale.

It is impossible to give, with any degree of exactitude, the extent of the ground covering the asbestos mines in the Aosta valley, as it has not yet been thoroughly surveyed; but as the valley is some 75 miles in length, and varies in width from 5 to 40 miles, some idea may be formed of it. Notwithstanding the large quantity of asbestos that has been got, enormous deposits remain untouched, and the yield may almost be considered inexhaustible.

The quality of asbestos in the Aosta valley is not, however, similar to that in the Susa valley. It is of the kind known as "grey fibre," long, strong, and soapy to the touch, and is similar to that obtained in the Valtellina.

A Canadian Asbestos Mine.

We must now pass to the Canadian mines; but before describing the method of working these mines, it is necessary to explain the difference in the character of the asbestos found as compared with Italian asbestos. According to Dr. Ellis, and several other Canadian authorities, true mineral asbestos—that is to say, the Italian variety—belongs to the hornblende group of minerals, while that which is produced in Canada at the present day under the name of asbestos is in reality not asbestos proper, but a serpentine rock called chrysotile. This occurs in veins in certain portions of the great belt of serpentine rocks of the Eastern Townships of Quebec, especially in portions of the Townships of Thetford, Ireland, Coleraine, and Wolfetown. Although asbestos was known at many points in Eastern Quebec more than thirty years ago, and was exhibited at the International Exhibition in London in 1862, no attempt was made to work it.

The credit of the discovery of the Thetford area is probably due to a French Canadian named Fecteau, and following up his discovery certain areas were secured from the Government by private parties. The value of the mineral was not at first recognised, and in the first year of mining operations, 1878, only 50 tons were taken out, for which a ready sale was not obtained. The publication of the prospectus of the United Asbestos Company in the year 1880, however, gave a great impetus to asbestos mining enterprises, and new companies obtained tracts of rocky land in the townships of Thetford and Coleraine, and began the work of exploration and mining, the result being that from the year 1884 to the present time large and increasing quantities of asbestos have been exported from Canada, a large proportion of which, however, would be of the qualities known as second and third grades, and used largely in the United States for covering steam boilers and pipes, roofing, building, and other purposes.

Although asbestos mining and prospecting in Canada has continued for sixteen years, and the areas of serpentine are very extensive, the

proportions in which asbestos of good quality or in paying quantities is found, are in comparison so small that mining operations are practically confined to two centres only a short distance apart.

The rock carrying the marketable asbestos is generally a serpentine of some shade of green on fresh fracture, usually a greyish green, in which are contained numerous small particles of iron, both magnetic and chromic, more usually the former. Serpentine that have a black, hard, chippy, aspect do not promise well. In the asbestos-bearing rock proper the veins of asbestos are seen, without any special arrangement, intersecting the mass of the rock generally in every direction. In size they range from mere threads, sometimes close together, to a thickness of one to two inches, and, very occasionally, three to four inches. The asbestos from these larger-sized veins, provided it contains no serious impurities, is classed as grade No. 1, and is used for spinning and weaving; the shorter stuffs and such as contain impurities are classed as No. 2 and No. 3 respectively, these latter grades, as already pointed out, being used principally in the United States for millboard, boiler and pipe covering, and other purposes.

The process as practised in Canada is strictly quarrying rather than mining. Owing to the different nature of the ground hand labour, which is essential in Italy, has been largely superseded by steam derricks, pneumatic drills, or other modern mining appliances.

When a block of asbestos-bearing rock has been displaced by the usual methods employed in blasting, the pieces are broken up, barren rock removed to "dumps," or waste heap, and the remainder passed through the process of "cobbing," whereby the last of the rock is removed, and the asbestos exported in a form ready for the manufacturer.

From our illustrations, which explain themselves, the difference in the working conditions is as clearly shown as the difference between the two specimens.

Specimen of Crude Canadian Asbestos.

The uses of asbestos are naturally more or less of a technical or commonplace order, being largely employed in making packing, washers, paper cloth, millboard, sewing thread, tape, tubing and gloves for furnacemen, &c. It also plays a very important part in the preparation of fire-proof paints, and in the direction of fire-proofing it has, through the ingenuity of the United Asbestos Company, Limited, at last been applied to the manufacture of highly artistic as well as fire-proof panellings. These panels, under the name of "Salamander" decorations, are used for lining the saloons of Atlantic liners, thereby not only rendering them fire-proof, but producing all the artistic effects of elaborate Lincrusta decoration.

### THE BROOKLYN POLYTECHNIC INSTITUTE.

CONSIDERING the growing importance of Technological Education, we believe the following particulars about one of the leading American Technological Institutes will prove as helpful as they are interesting. For many years the Polytechnic Academy has been one

executive head. He has held many responsible official positions, being chairman of the New York section of the American Chemical Society, and a member of a number of other scientific societies at home and abroad. He has succeeded happily in keeping in touch with both pure and applied science, and hence the success of his work as a teacher of Chemical Technology.

CHEMICAL LECTURE THEATRE.

of the most celebrated of American Schools, and many distinguished professional men and leaders in the business world owe their success to the thorough training and careful development of character received at the "Poly." The school is situated near the City Hall and in the heart of Brooklyn, a city which is now rated at about a million of inhabitants. Although the standard of instruction is very high the number of boys in attendance is about eight hundred. A few years ago the Corporation of the Polytechnic, which includes some of the most prominent and wealthy citizens of Brooklyn, decided to add advanced courses and to found a college. A fine and commodious building, six storeys high, was erected at a cost of £75,000. The lecture and recitation rooms were equipped in accordance with the most modern ideas of scientific instruction, particular attention being paid to the gymnasium, swimming pool, and other details necessary to physical culture. Courses in Civil and Electrical Engineering and a Liberal Course, in which the classics are substituted by modern languages, were inaugurated, and men highly distinguished in their professions were called to take charge of them.

#### THE CHEMICAL SECTION.

The last course to be developed was the Chemical. In charge of this has been placed Peter T. Austen, Ph.D., F.C.S., formerly professor of chemistry in Rutgers College and the New Jersey State Scientific School, a chemist who was a student of Hofmann, and who has achieved an enviable reputation, both as a teacher, an organizer, and

Chemistry is taken up in the freshman year, a course of elaborately illustrated lectures being given, accompanied by "quizzes" and written recitations. In conjunction with this a course in experimental chemistry is given in the laboratories. This is followed by another course in experimental work, in which the experiments are mostly test-tube tests, but each experiment is made the subject of a searching "quizzing" about the nature of the re-actions involved, and demands a great deal of re-action writing and a careful study of the chemical changes and principles which are involved. Blow-pipe analysis follows. After the students have acquainted themselves with the behaviour of the elements under the blow-pipe a number of substances are analysed. Qualitative analysis is then taken up and fully developed, the laboratory work being accompanied by systematic "quizzing" and formulæ writing. Quantitative analysis begins with the analysis of pure substances, the student being required to re-crystallize and purify the substances analysed. This work is followed by the analysis of minerals, ores, and commercial substances. Later on the preparation of pure chemicals, organic analysis, and a course in experimental organic chemistry are taken up. Theoretical chemistry, chemical technology, organic chemistry, and stoichiometry are also fully taught. The graduates are encouraged to

take post-graduate work and perfect themselves in the methods of preparing chemical substances and undertake original investigation.

In addition to the chemical work the course includes instruction in

QUALITATIVE LABORATORY.

the subjects essential to a broad course of study, especial attention being paid to mathematics and a thorough knowledge of sight reading of scientific French and German. This is made obligatory, as in the senior year text-books in these languages are used.

The following schedule gives an outline of the studies of the course, several of the higher mathematical and classical subjects being

QUANTITATIVE LABORATORY.

omitted:—Solid Geometry, Chemistry (illustrated lectures), French, German, Inventive Geometry, Mechanical Drawing, Higher Equations, Logarithms, Electricity and Magnetism, Qualitative Analysis, Laboratory Manipulations, Engineering Field Work, Adjustment and Use of Instruments, Mechanics, Stoichiometry, Experimental Chemistry, Geology, Blow-pipe Analysis, Theoretical Chemistry, Hydraulics, Pneumatics, Acoustics, Heat, Optics, Quantitative Analysis, Chemical Technology, Crystallography, Mineralogy, and Organic Chemistry.

#### LABORATORY WORK OF THE CHEMICAL COURSE.

The following are the details of the Chemical course:—Introduction to Chemistry, Changes of Substances, Relations between Changes, Mixtures and Compounds, Chemical Action, Preparation and Chemical Conduct of Oxygen, Oxidation and Combustion, Preparation and Chemical Conduct of the Commoner Elements and their Compounds, Acids, Bases, Salts, Flame, Crystallization, Metals, Hydroxides, &c.

#### BLOW-PIPE ANALYSIS.

Blow-pipe Manipulation, Coat Tests, Bead Tests, Matrass and Tube Tests, Special Tests, Analysis of Substances by the Blow-pipe.

#### QUALITATIVE ANALYSIS.

Chemical Manipulations, Characteristic Reactions of the Elements and their Compounds, Classification of Substances by their Chemical Conduct, Qualitative Analysis of Substances, Examination of Natural and Technical Products, Special Forms of Testing, and Spectrum Analysis.

#### QUANTITATIVE ANALYSIS.

In addition to the usual salts which are prepared in a pure state and then analysed the course includes the following:—Copper Ore, German Silver, Waters for Boiler Use and Manufacturing, Water for Potable Use, Complete Fertilizer, Cast Iron, Wrought Iron, Steel, Vinegar, Bicarbonate of Soda, Chlorimetry (Bleach), Acetate of Lime, Coal, Milk, Lubricating Oil and Soap.

#### ORGANIC CHEMISTRY.

Preparation and Chemical Conduct of Methane, Chloroform, Monobromethane, Alcohol by Fermentation, Ethyl Ether, Aldehyde, Formic Acid, Acetic Acid, Ethyl Acetate, Acetyl Chloride, Cyanides, Cyanates, Sulphocyanates, Isocyanides, Saponification, Oxalic Acid, &c., and other Substances representing the Typical Classes of Organic Compounds and their Characteristic Changes, Visits to Manufactories.

#### POST GRADUATE WORK.

Qualitative Analysis applied to the Rare Elements, Testing of New Methods in Quantitative Analysis, Special Quantitative Methods, including Ultimate Organic Analysis, Preparation of Inorganic and Organic Substances, Assaying, Experimental Study of Waste Products, Technical Processes and Problems in Manufacturing Chemistry, Experimental Investigations in Pure Chemistry, Reading in the History of Chemistry, Pure and Applied Chemistry and Journal Literature, Photographic Processes, Dye Testing.

Professor Austen is assisted by Gillett Wynkoop, B.A., B.Sc.; W. Homer Broadhurst, B.Sc.; W. F. Doerflinger, B.Sc.; and H. M. Baker, jun.

Within an hour's travel of the Polytechnic there is embraced a number of cities exclusive of New York, making a total population of about four millions. There is hence an ample field for the Institute as well as for the other Colleges.

SPICER LIBRARY.

## STAMPED STEEL BARRELS.

IT does not need any lengthy dissertation on the familiar wooden barrel to explain the advantages of the Caird Patent Steel Barrel over the old leaky combination of hoops and staves. It will be apparent to anyone who has had experience in the transit of liquids or chemicals in barrels, that for oils, like petroleum, varnishes, spirits, or chemicals, steel barrels must be as safe and handy as they are economical. There is no loss in transit, and repairs become an almost unknown quantity.

For chemicals and acids the barrels can be lined with copper or acid-resisting materials, while for liquids that require to be kept from contact with contaminating bodies they can be galvanised or tinned. From an industrial point of view, apart from their many obvious advantages, these barrels present a novel feature in the removable head. For solids or semi-solids such as soft soap, tallow, soda crystals, and other solid chemicals, this feature is of great importance, as with the old wooden heads it was necessary to break them in, after which it was not easy to effectually close the barrel when once opened. This advantage is illustrated in the first of the accompanying cuts. The second cut shows a very handy application of a stamped steel drum to the purposes of domestic storage. The tightness and cleanliness of this particular form should make it very popular with householders.

The barrels are made in two portions, being swaged from steel plates, the thickness of which is varied to suit the size of the finished barrel. The sections are joined by spinning the edges together, the locking being done in a manner that renders leakage impossible. A further advantage attaches to this method of uniting the two sections, in that the spun joint strengthens the barrel at the point of largest circumference, where in the course of ordinary usage the wear and tear is heaviest and the risk of denting greatest. The smaller sizes have one joint only, but the larger barrels are made in three or more sections. The weight is the same as that of an ordinary wooden barrel of equal capacity, while as they are made to gauge they always contain the same quantity whether in the 5 or 120 gallon sizes. The diameter of the former is about one foot and of the latter just under three feet. There are 250 of the small barrels to the ton.

The small steel drums are stamped in the same way as the barrels, though they are of different shape and construction.

The makers of these barrels and drums are the Iron and Steel Plant Co., Ltd., of 3, Crown-court, Old Broad-street, E.C. (the works being at Barrow-in-Furness), who are exporting them in considerable numbers, as samples, to all parts of the world. Additional and independent testimony to the utility of the barrels is afforded by the fact that the company was recently awarded a gold medal at the Middlesborough Exhibition.

## Our Book Shelf.

SOAP AND CANDLES. W. L. Carpenter. 2nd edition. Enlarged and revised by H. Leask. 446pp., with index. 104 illustrations. London: E. & F. N. Spon. 1895.

There are very few, in one industry or another, to whom the first edition of this work is not known, as it not only contains an account of manufacturing processes, but also describes methods of preparation which are of service to those desirous of producing in small quantities. The task of revision has apparently been ably executed as far as the text is concerned. The illustrations on the whole are good, but, with a few exceptions, the standard attained is not very high. The first eleven chapters deal with the history and theory of soap-making, the sources, preparation, and analysis of the raw materials and chemicals utilised, and the making, cutting, drying, and moulding of household soaps. There is also a brief reference to the theory of the action of soap and its valuation. In Chapter XII., we have an excellent article from Mr. J. Veitch Wilson on "Lubricants," under which heading a vast amount of information upon a number of widely varying products will be found. The remaining chapters are devoted to the manufacture of candles and the preparation of the materials used therefor. The weak point of the book is the chapter on glycerine, which is mainly devoted to a review of the patent literature of the subject. As a manufacturer's handbook on soaps and candles the work is, however, worthy of the strongest recommendation, the new edition containing much that all connected with these trades will do well to study.

HANDBOOK OF INDUSTRIAL ORGANIC CHEMISTRY. By S. P. Sadtler. 2nd edition. 537pp., including index. 127 illustrations. 14 diagrams. London: J. P. Lippincott & Co. 1895.

The best recommendation that this work can have is afforded by the fact that in such a comparatively short time a second edition has been called for. The aim of the book is somewhat out of the ordinary, for while its scope is very wide some of the information is very condensed. It is owing to this latter feature, however, that we should be inclined to attribute the success of the work, as it affords a convenient handbook from which all essential facts can be gathered in a few minutes, leaving details to be sought in the carefully prepared bibliographical appendixes which follow the various sections. The comprehensiveness of this work can easily be seen when we say that no less than 22 different industries are dealt with in its pages. The text has apparently been but slightly altered since the first edition, the chief changes being manifest in the bibliography, which in all cases has been carefully re-written and brought up to date. There are also several new tables and additional statistics. The work very truly justifies its title, and as a handbook of industrial organic chemistry it would be difficult to find another which at the same time is so well illustrated, so easy of reference, and so reliable.

GAS MANUFACTURE. By W. J. A. Butterfield. 375pp., with index. 62 illustrations. London: Chas. Griffin & Co., Ltd. 1896. 9s.

This is another addition to this firm's Text-book Series, and be it also said, a good one. From the sub-title we learn that the work aims at being a practical handbook of the chemistry of gas manufacture. It deals in particular with the production, purification, and testing of illuminating gas, and the assay of the bye-products in this industry. The illustrations are good, and in many cases original. As compared with other books on similar lines, the striking features are the treatment of gases other than coal gas, and enrichment processes. The chapter on photometry is one of the best in the book, and that on the applications of gas is out of the common, and interesting. On matters connected with the analysis of the bye-products there is a disappointing lack of detail, which in cases is very pronounced, though the chapter on gas analyses itself is much better in this respect. With this exception, unstinted commendation is certainly justified, and as the book is one that we venture to think will certainly call for subsequent editions, there should be little difficulty in removing this blemish.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

There is no change in the position of tar products, the market being quiet but steady. Benzols are as last quoted. Carbolic acids firm at 1s 9½d. for 60% crude, and 6½d. for 40% crystals. Solvent naphtha 1s. 6d. and crude 10d. Pitch slightly easier at 37s., f.o.b., East Coast.

Sulphate of ammonia is weak both in spot and forward positions. London outside makes are quoted at £8. 10s. spot, the same figure applying to Hull and Leith. Liverpool £8. 11s. 3d. Beckton price for February-March is £8. 12s. 6d.

### MISCELLANEOUS CHEMICAL MARKET.

In the alkali trade there is nothing special to note for the past week. Business continues fairly active, and all the works are well engaged with orders. Prices have been without any movement. Current quotations are for bleaching powder, f.o.b. Liverpool: £7. 5s. to £7. 10s., according to market; £7. f.o.r. makers' works. Alkali, 58%, £3. 7s. 6d. bags, f.o.r., and £3. 12s. 6d. to £3. 15s. casks, f.o.b. Soda crystals £2. 2s. 6d., f.o.b. For caustic soda the improved demand is still maintained, and prices are steady at:—F.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 10s.; 70%, £7. 10s.; 60%, £6. 10s. per ton, 10-ton lots and upwards. Chlorate of potash 4½d. to 4¾d. per lb. Chlorate of soda, 6½d. Price for nitrate of soda on the spot is 7s. 6d. per cwt., and forward business has been done at 7s. 9d. Saltcake 27s. 6d. per ton, f.o.r. Sulphate of copper £15. 10s. to £15. 15s., f.o.b. Liverpool. White powdered arsenic has further advanced, owing to great scarcity of supply, to £16. 10s., f.o.r. Garston. Potash, caustic and carbonate, continue to meet with good inquiry, and prices are well maintained. Green copperas is a steady market, all cheap supplies having been taken up. Acetate of lime, brown, still remains at £5. 2s. 6d. to £5. 5s. nett, c.i.f. English ports; grey £7. 10s. per ton. Acetate of soda in good request at £14. 5s. to £14. 10s., c.i.f. Acetic acid is still offered at low prices, and in all other acetates there is no perceptible sign of improvement. Sulphocyanides are in fair demand, and without change in value. Carbolic acid crystals meet with ready sale, and price is firm. Yellow prussiate of potash selling at 7¾d. to 8d. per lb., according to make. Cyanide, 95/98%, 1s. 4d. per lb. For borax and boracic acid the prices are more firmly held, owing to the better understanding among the makers. Murate of ammonia is in active request, and price firm at £22. 15s. to £23, in usual districts of consumption. Other ammonia salts steady in price. Generally trade is reported quiet in chemicals.

### LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—There is a small business doing in palm oil, Lagos selling at £20. 5s. transit and New Calabar £18. 10s. to arrive. Olive is quietly moving, with limited sales of Seville at £30. 10s. per tun. There is a weaker tone in linseed, which is now offering at 20s. 6d. to 21s., for Liverpool makes in export casks. Cottonseed is steady, prices for Liverpool refined being 17s. to 17s. 6d. per cwt. Castor oil is steady, a moderate business being done at 2½d. for good seconds Calcutta, and 2¾d. per lb. for first pressure French. There is nothing to be said about tallow, save that it is quietly steady. Resin is more active on spot, and holders keep steady at late rates for the lower grades. Spirits of turpentine are steady at 21s. 9d. per cwt., there being a fairly large amount of business doing at this figure. Petroleum is quiet, though so far there have been no changes in price, American still standing at 7¾d. to 8d., and Russian refined 7d. per gallon.

### HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

OILS.—The general situation in the oil trade here is satisfactory, the demand being well sustained and values show little alteration, excepting an advance of almost £1. per ton in rape oil. The shipments of cottonseed from Alexandria for the United Kingdom since September 1st have been:—Hull, 88,060 tons, against 89,000 tons a year ago; London, 25,500 tons, against 31,400 tons; other ports, 53,580 tons, against 47,300 tons. The imports during this year, 1896, have been:—Linseed, 30,803 quarters, against 12,642 quarters a year ago; rapeseed, 1,210 quarters, against 11,466 quarters; cottonseed, 10,401 tons, against 5,137 tons; olive oil, 341 casks, against 759 casks; rape oil, 175 casks, against 250 casks; oil cakes, 1,500 tons, against 1,141 tons; tallow, 776 cwt., against 1,107 cwt.; bones, 572 tons, against 50 tons; turpentine, 2,612 barrels, against 2,952 barrels. Linseed oil steady at 19s. naked spot, January-April offer at 19s., and May-August 18s. 10½d.; boiled and refined ditto, £1. to £2. per ton extra. Refined cotton oil steady at 14s. 9d. naked spot, January-April quoted 15s. 1½d., and May-August 15s. 10½d.; ordinary

barrels 30s. and casks £1. per ton extra. Export for week, 3,860 cwt. Spanish olive oil offers as low as £30. per tun, ex ship. Spirits of turpentine, 22s. 3d. per cwt. Castor oil firm at previous quotations. Siccative oil, £13. per ton. Liquid soap, £16. per ton. Cod oils from £16. 10s. to £19. per ton. Mineral lubricating oils are scarce and firm in price. Sweet fat, £26. per ton, in 1-cwt. kegs. Locomotive grease, £12. per ton.

CAKES.—Linseed cakes are a firm market: 95% pure, £6. 5s.; Russians, £5. 17s. 6d. Oil cakes, £5. 5s. Cotton cakes steady: best makes, £3. 15s.; seconds, £3. 10s. to £3. 12s. 6d. Rape cakes unaltered.

PAINTS.—This trade here is working at high pressure, makers being exceptionally busy, and here and there a confession is extracted that the result of last year's trading is eminently satisfactory. Prices:—White lead is very firm in price, as also red lead, being quoted £16. 10s. and £14. 10s. per ton respectively; oxide zinc from £22. to £26. Dry mineral colours unchanged and in good request. Ultramarines, 3d. to 8d. per lb.; black, blue, red oxide, green, and venetian red paints from £11. per ton. Ready-mixed paints, in lever tins, one, two, four, and seven pounds, from £24. per ton. Paint remover, 25s. per cwt. Natural belt dubbin, 12s. per gallon.

### TYNE CHEMICAL REPORT

TUESDAY.

The chemical trade is still quiet, though there is perhaps a shade more business, and shipments for the time of the year are fairly good. Soda crystals are quoted at £2. 2s. 6d. per ton, gross weights, locally. Sulphur scarce at £3. 17s. 6d. per ton. Caustic, 76/77% £9. 5s., and 70% £7. 10s. to £7. 15s. per ton. Other products unaltered.

Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £50.

SALT.—South Durham salt is steady at 9s. 6d. per ton, f.o.b., Tees.

COALS.—There is practically no alteration in the market, and prices show an advance of about 3d. on last quotations.

### WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

In sulphate of ammonia there has been a rally of a sort, very feebly in its kind, and probably due only to monetary causes. At Leith, but not at Glasgow, £8. 11s. 3d. has been paid for prompt, but the feeling, as reflected from the continent, does not at all back up the idea of a real recovery, for there the view taken is more decidedly to the low side than ever. The forward market is quite idle here. The general chemicals market opens the New Year with fairish prospects. The call for deliveries is not a very loud one, but prices for the most part are firm and steady. Sulphate of copper is cheaper, but all the others remain as before. Mineral oils continue in large deliveries at the old prices firmly held, but the period is now approaching when the consumption of burning oil will begin gradually to draw in for the season. Naphtha is steady at the old quotations. The position of scale and wax is still indeterminate, and the agreement prices given below must be held as merely nominal, there being for the moment no agreement. A meeting took place in London last week, producing no change in the situation. Another meeting takes place in Glasgow this week, but it is not expected that this will put a finish to the dispute in any way.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56%, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52%, £4. 10s. to £5. nett, Tyne; alum in lump, £5. 10s. nett, Glasgow; caustic soda, white, 76° £9. 5s., 70/72° £7. 10s., 60/62° £6. 10s., and cream 60/62° £6. 10s., all nett, Liverpool; bleaching powder, £6. 15s. to £7. 5s. nett, Tyne; saltcake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¾d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow).

## CURRENT TOPICS.

### COAL AND THE CHEMICAL TRADE.

IT is a generally recognised maxim that troubles never come singly, and the experience of the past year, as far as the chemical trade is concerned, fully justifies the truth of this statement. The Board of Trade returns for the past month have, however, shown a more satisfactory state of trade than has been known for some months, and even if it is scarcely wise to infer that trade will improve markedly, it is, nevertheless, very evident that it has passed the turning point, and is beginning to mend. It is, however, pretty certain that its full convalescence will not be accomplished without encountering some difficulties, the most formidable of which threatens to arise from the unsettled state of the coal trade. From the producers' point of view, although there has certainly been a distinct revival in the iron trade, there has likewise been increased competition in the contracts for gas and locomotive coals, with the result that prices have been "cut" severely, and in some cases, it would seem, unnecessarily. Further, the remarkable development of the Westphalian and other Continental coal-producing districts is, to say the least, by no means encouraging, as there is good reason to suppose that these districts will soon compete with us for the Baltic and northern trade. Such is the position of the producers, and it is one which will not cause them to look with favour on any proposition concerning increased wages.

To turn to the miners, they evidently hold strong opinions as to what they want, and what they think they are entitled to. To judge by the general attitude of the leaders of their Federation, it is highly probable that the 10 per cent. advance, arranged under the terms of the Conciliation Board, will be demanded, for ever since 1893 the Federation has fought persistently against any reduction of the 30 per cent. advance which was secured. If the additional 10 per cent. is insisted upon and conceded, the miners will again be receiving the full 40 per cent. which they once enjoyed, and the attainment of this seems to be their real object, no matter how their intentions may be cloaked. This opinion is strengthened by the fact that the recent ballot of the Durham miners resulted in a majority of 30,568 out of 45,462 in favour of withdrawal from the Conciliation Board; though, in considering the representativeness of this vote, it must be borne in mind that there were 20,000 neutrals.

Such is the general position of both sides, and it is needless to say anything on the attitude of the multifarious industries whose welfare depends upon a regular and fairly cheap supply of fuel.

Should the masters set their faces against any advance, relations will assuredly become very strained, and it will take very little to send us headlong into another coal strike. In anticipating such an event, it seems a very difficult task to

SUBSCRIBERS ARE REQUESTED TO NOTE THAT THE

## INDEX and TITLE PAGE for VOL. XVII.

WILL BE ISSUED WITH NO. 457, FEBRUARY 22, 1896.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

Readers will oblige by making their remittances for subscriptions by Postal or Post Office Order, crossed and payable to "Davis Bros."

Articles, reports, and correspondence on all matters of interest to the Chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion.  
Each additional 10 words ..... 0s. 6d.

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

30 Words and under ..... 1s. 6d. per insertion.  
Each additional 10 words ..... 0s. 3d.

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff rates, which will be forwarded on application.

Advertisements intended for insertion in the current week's issue should reach the office by Thursday morning at the latest.

say who ought to give way, and it is still more difficult when we remember that even after a very severe fight, arbitration was not abundantly successful in healing the rupture caused by the last strike. If anything, we are inclined to think that, since trade is really mending (and it cannot continue to do so if the coal strike intervenes), it would be incumbent upon the employers to think a long while before deciding to hold out for every tithe and tittle of their rights. The question is one that can hardly be judged by a precise consideration of rights and wrongs. There must be a good deal of give and take, and past experience has shown that the former has mostly to be practised by the employers. Yet up to now we do not think they have been losers by their forbearance.

With regard to the miner, there is one point we think it is desirable to emphasize. An inquiry has recently been made into the relative conditions of the British and Continental iron trades. There appear to be no startling revelations with regard to wages, which on the whole are much the same as they are at home, but particular stress is laid upon the character of the workmen themselves. There is a marked absence of the "slovenliness, noise, and idling about" that is all too characteristic of the British workman. Again, reference is made to the remarkably steady growth of the iron industry in Germany. As the report says, "this may of course be due to the greater steadiness of trade, but it may also be due to the more steady-going character of the workmen employed." Employés in this country will do well to lay to heart the covert insinuation which these words convey. If they do so, and, in their own interests, act up to the hint which is given, we feel sure they will likewise find many of our somewhat languishing industries improving, in the same way as those on the Continent, which are now causing so much discomfiture by the competition they are creating.

#### THE RAND OUTPUT IN 1895.

The production of gold in the Rand has reached the total that was foretold, but how deeply the latest developments in the Transvaal have affected the gold industry the figures for the month only too clearly show. They also indicate how in anticipating the achievement of a certain end it is desirable to leave a wide margin for contingencies.

In taking note of the total production it must be remembered that the returns are exclusive of the output of the New Chimes and Kleinfontein Companies. Without these the past year shows an increased production of 253,486 ounces, the actual total being 2,277,635, while the corresponding figures for preceding years are given elsewhere in this issue. The total for the month shows that it was a safe prediction to say the year's increase would be a quarter of a million ounces, for not only is the total for December the smallest in the year, with the exception of January and February, but for the first time in the year the total was lower than that for the same month in 1894 by 3,676 ounces. Taking the average of the six months, June to November, as representing the production for December under ordinary conditions, the total of the year would have been greater by nearly 20,000 ounces. Naturally there will be some anxiety as to the show the present month will make, and for our own part we are prepared to see rather tame returns for the first quarter of the year.

#### THE BITER BIT.

An amusing case was recently heard before the Brentford magistrates, involving the question of whether in selling Seidlitz Powders, chemists are bound to adhere to the formula prescribed in the British Pharmacopœia. Since the Pharmaceutical Society has been very actively waging war

against grocers and unregistered chemists for selling scheduled poisons in sheep dips, patent medicines and similar familiar articles, it is somewhat amusing to find the tables turned, and the County Council prosecuting a chemist, under the Food and Drugs Act, for not supplying a drug, namely a Seidlitz Powder, of the nature, substance and quality of the article demanded.

A good deal of interesting evidence was given on both sides, and it seems that while not conforming with the requirements of the P. B., the error has been making the Seidlitz powders too strong. It was clearly shown that almost all chemists sell two qualities, one of which is in strict accordance with the P. B., while the other is made of any strength that fancy may dictate, but generally stronger rather than weaker. This latter point was made much of on behalf of the defence, it being stated that customers were always asked which quality they required, the ordinary or the best. The Bench, however, thought a good deal of doubt seemed to be attached to the meaning of the word "best." It did not mean necessarily the strongest, and they therefore gave a conviction with a small fine, allowing time, however, for the defendants to decide if they would appeal.

### LOW TEMPERATURE RESEARCHES.

BY H. GRIME.

(Concluded from page 19.)

IN a paper published in the *Philosophical Magazine* for July Dewar and Fleming give a preliminary notice of some investigations of the thermo-electric powers of metals and alloys between the temperature of the boiling-point of water and that of liquid air, that is, over practically the same range as covered by the experiments on resistances. Thermo-electric power is defined thus:—"If one junction of a thermo-electric couple is at a temperature  $t^{\circ}$ , and if the two junctions of the couple differ in temperature by a very small interval  $d t$ , and if the electromotive force of the couple under these conditions is  $d E$ , then the thermo-electric power of the couple at the temperature  $t^{\circ}$  is equal to the

ratio  $\frac{d E}{d t^{\circ}}$  Professor Tait showed that on certain assumptions the curves representing thermo-electric powers plotted as a function of the temperature should be straight lines, and that, therefore, the lines of thermo-electromotive force in a thermo-electric couple of two metals, one junction of which is kept at a constant temperature whilst the temperature of the other junction is raised, should be parabolas with their axes vertical, if plotted in terms of the variable temperature as abscissae. Tait experimentally proved the correctness of his speculations for a number of thermo-electric couples at temperatures within the range of the mercury thermometer. But he found that the thermo-electric lines of certain metals, notably of the magnetic metals, nickel and iron, are, for temperatures above  $0^{\circ} \text{C}$ , broken lines characterised by sudden changes of direction. Dewar and Fleming have extended Tait's observations, and have published their results in the form of a chart showing by curves the electromotive forces in C. G. S. units, of a couple formed of pure lead and some other metal or an alloy, the temperature of one junction of the couple being kept at  $0^{\circ}$ , and the other being caused to vary. They purpose giving the curves for thermo-electric powers in a subsequent paper. In the meantime they point out that none of the curves are true parabolas over their whole extent. Many, indeed, are curves of double curvature, and in some cases point to the existence of more than one neutral point with lead. The lines of iron and steel have changes of curvature at certain points, which indicate that the thermo-electric lines are broken lines. The Bismuth line is very peculiar; there is a sudden break at about  $-80^{\circ}$ . Incidentally it was found that the thermo-electric value of Hadfield's 12 per cent. manganese steel differed according as it was non-magnetic or rendered magnetic by being heated to a full red heat.

We have now considered some mechanical, chemical, optical, thermal, magnetic and electrical properties. It remains to say a few words about the influence of low temperatures on living organisms. Inasmuch as chemical activity is so much diminished, it is only to be expected that life processes will receive a severe check. It is found that intensely cold bodies are as destructive of human tissues as very hot bodies. Pictet states that one day he accidentally received two wounds on the same hand—one produced by liquid air, the other by fire. The latter healed in ten or twelve days; the cold-burn was still open six months afterwards. In the case of the more serious cold-

burns "the skin is rapidly detached, and all the parts reached by the cold behave like foreign bodies. A long and stubborn suppuration sets in, which does not seem to accelerate the reconstitution of the tissues. The wounds are always malignant, and scar very slowly, and in a manner different from burns produced by fire." It is a fortunate circumstance for workers in this field that the layer of vapour formed between very cold liquids or solids and warmer bodies, hinders close contact. In order to try the effect of radiation in dry, cold air, M. Pictet held his bare arm up to elbow in a refrigerating vessel maintained at  $-105^{\circ}$ , of course without touching the metallic surface. "A strange sensation was experienced over the whole skin and throughout the muscles. It was not disagreeable at first, but gradually became decidedly so, and appeared to have its seat in the central bone or periosteum. After three or four minutes the skin was rather blue, and the pain became more intense and deep-seated. On withdrawing the arm at the end of ten minutes a strong reaction was experienced, accompanied by a superficial inflammation." He tried similar experiments with several animals. A dog was placed in a copper receiver cooled down to  $-90^{\circ}$ . "In the first ten minutes its temperature, instead of falling, rose by about half a degree. On further exposure, however, the extremities became cold, but it was not until after about 90 minutes that the body temperature fell. Then followed a point at which the struggle for existence was given up; the temperature fell rapidly, and the animal died suddenly." As for lower organisms, it was found that insects resist a cold of  $-28^{\circ}$  but not of  $-35^{\circ}$ . Snails are not killed by temperatures down to  $-120^{\circ}$ . Frog's spawn bears a temperature of  $-60^{\circ}$ , and silkworm eggs a temperature of  $-40^{\circ}$ , but eggs of birds are said to lose their vitality at  $-2^{\circ}$  or  $-3^{\circ}$ . According to Pictet, "our secret friends and foes" are not destroyed by a temperature so low as  $-213^{\circ}$ . Professor McKendrick submitted blood, milk, flesh, and such like substances in sealed glass tubes for one hour to  $-181^{\circ}$ , and then kept them at blood heat for some days. When the tubes were opened the various substances were all found to be putrid. Seeds also withstood the action of this low temperature.

It is not necessary here to vindicate the time, energy, and money spent in low-temperature research. Still it may be pointed out that already these researches have borne practical fruit. Within the last twenty years the artificial production of cold has become an important industry. Some hundreds of patents have been taken out in connection therewith. Frozen meat has become a common article of commerce, and at least one important city has erected large cold air stores. Discoveries of the physicist and chemist have furnished the mining engineer and the builder with new resources. News of a recent instance of this comes from New York. Owing to the swampy character of the surroundings great difficulty was experienced in the preparation of a foundation for the retaining wall of a new speedway at High Bridge. A row of 4-inch pipes, closed at the ends, were sunk to a depth of 40 feet. Smaller pipes, open at the bottom, were placed inside these, and cold air at a temperature of  $-45^{\circ}$  forced along them. By this means the mud and wet sand were frozen, and no longer flowed into the excavation. Some years ago Pictet opened a laboratory specially devised for low-temperature research at Berlin. In that laboratory experiments have been carried on not only of, apparently, merely scientific interest, but also of immediate practical importance. For example, Paalzow has determined the elasticity of solid mercury by freezing the metal in the form of a tuning-fork; and Cognac was endowed with all the mellowness of old age by a short course of treatment at  $-200^{\circ}$ . Sulphurous ether was quickly purified by successive freezings. And by the simple process of fractional crystallization at low temperatures a sample of chloroform was obtained, which was unaltered by exposure to light. More important still it was found that the use of such purified chloroform was not attended by the dangers which seem to accompany the use of ordinary chloroform as an anæsthetic. I have already referred to the growing commercial importance of liquid gases. Jules Verne and Lord Playfair have speculated on the probable use of liquid carbon dioxide or sulphur dioxide in time of war. Whether they ever play any part in the victories of war or not, we may safely predict an important place for liquid gases in the still greater victories of peace. And, considering the great progress made in low-temperature research during the last twenty years, it seems not too much to hope and expect that another twenty years will make the bounds of freedom wider yet, and enable physicists to study matter not merely *near*, but *at* what is now called the absolute zero of temperature.

**FIRE AT A CHEMICAL FACTORY.**—About eleven o'clock on last Saturday night the Salford Fire Brigade was summoned to the works of Messrs. Hervey, Peek, and Hervey, manufacturing chemists, Ordsal-lane, Salford. It was found that the gum stores in the drying mill were on fire, but Mr. Bentley and his men were able in a short time to put out the flames. The fire was confined to the part of the building in which it began. It is understood that the cause of the outbreak was the overheating of a stove.

## GOLD PRODUCTION IN THE RAND DURING 1895.

THE total output from the Rand district during December amounts to 178,428 oz., and shows a decrease of 16,790 oz. as compared with the previous month's total. The following table gives the monthly returns since the beginning of 1891:—

|             | 1891.<br>oz. | 1892.<br>oz. | 1893.<br>oz. | 1894.<br>oz. | 1895.<br>oz. |

## ARGON AND HELIUM.

AT the Royal Institution last week a large audience assembled to hear Lord Rayleigh give some further particulars about argon. Sir Frederick Abel was in the chair, and among those present were Sir Benjamin Baker, Sir James Crichton-Browne, Sir Douglas Galton, Professor Dewar, Professor A. B. W. Kennedy, Professor Ramsay, Dr. Frankland, Professor D. E. Hughes, Mr. Thorncroft, Professor S. P. Thompson, Professor Roberts-Austen, and Professor Vernon Boys.

Lord Rayleigh first dealt with the density of argon. At the meeting last year he had, he said, only been able to speak of the density of argon prepared by the magnesium method. It was at that time his aim to weigh argon prepared by the oxygen method, and it was important to do so in view of the question whether argon prepared by the magnesium method was the same gas as that obtained by the oxygen process. He mentioned the difficulties he had to meet in getting three litres of argon, the amount with which he had been accustomed to work in his determinations of the densities of other gases. These difficulties were mainly due to the slow rate at which the nitrogen could be eliminated by means of the electric spark. He described the improvement he had effected in his apparatus at the suggestion of Professor Ramsay. The nitrous fumes formed in the process were absorbed by alkali, and Professor Ramsay's suggestion was to produce a fountain of alkali in the vessel, and so expose a larger surface for absorption of the gases. Another advantage gained was that the alkali solution welling up protected the glass from the heat of the flame. The voltage employed was about 3,000. In this arrangement nitrogen and oxygen were combined at the rate of about seven litres an hour. One curious effect was noted. Though the fountain made it quite possible to use a large arc in a small vessel, yet it was found that, everything else being equal, in these circumstances the rate of absorption was very much reduced. The determination ultimately made by Lord Rayleigh of the density of argon prepared in this apparatus was 19.940, which almost exactly equalled that found by Professor Ramsay for the gas obtained by the magnesium process. This fact allowed the inference that the gases prepared by the two processes were identical, and also suggested, though it did not prove, that the gas was not a mixture. It was also unfavourable to the view supported by some eminent chemists that argon was an allotropic form of nitrogen, since the weight of that modification should be 21. Lord Rayleigh then spoke of the refractive index of argon, and after giving some account of the method he employed in estimating it, stated it to be .96, air being taken as 1. From the fact that the refractivities of air and argon were so nearly alike it might again be inferred that argon was not the allotropic form of nitrogen represented by  $N_2$ , ordinary nitrogen being  $N_2$ . Passing to his examination of the gas given off by the Bath springs, he said the proportion of argon appeared to be less than existed in the air. Subsequently, however, Professor Ramsay discovered helium, and then it occurred to him as an explanation of this that helium, being as inert as argon, might be present in the residue, and by its lightness compensate for the heaviness of the argon. He found the line  $D_3$ , too, unmistakably in the spectrum of the residue of this Bath gas, and that showed the presence of helium; he did not, however, consider it was present in sufficient quantities to make the explanation just suggested tenable. In gas from springs at Buxton there was some 2 per cent. of argon, with a doubtful indication of helium. The question whether there was helium in the atmosphere was an interesting one, but experiments seemed to show that there was not one part in 10,000 of air. It must, however, be present in a mathematical sense, seeing that it was given off by certain springs. Lord Rayleigh concluded his lecture by some remarks on the viscosity of argon, which he found to be 1.21 as compared with air.

## Official Memoranda.

(From the Board of Trade Journal.)

### THE ASBESTOS INDUSTRY OF CANADA FOR 1894.

According to the "Bolletino di Notizie Commerciali," the production of Canadian asbestos in 1894 amounted to about 8,600 tons. This figure shows a decided increase on the preceding year, and the export of the mineral proves that the demand for raw asbestos is greater than it has been for the past three years.

The Quebec Central Railway carried 7,318 tons of asbestos last year, an amount only exceeded in 1891, when it reached 7,774 tons.

Eight companies for the mining of asbestos were working in 1894, employing altogether about 800 men and boys.

About 1,000 tons were sent to the United States; the rest to various parts of Europe.

All exportations were made direct to manufacturers, and not, as before, to middlemen or agents.

The proprietors of the mines have adopted a system of only extracting enough of the mineral to carry out the contracts of their customers, so that there is now no danger of a glut in the market.

The value of the amount produced last year is roughly calculated at £100,000.

### PAPER MILLS IN INDIA.

According to information received from the India Office, there are ten paper mills—four in the Bombay Presidency, four in Bengal, one at Lucknow, and one at Gwalior, which was worked for a short time only in the past year and then closed. Of the ten, three are private concerns in the Bombay Presidency, one of which has not been at work for many years. The others have an aggregate nominal capital of Rs. 612,200. The fibrous materials used for making paper are chiefly rags, babui and moonj grasses, straw, jute and hemp cuttings, and old jute bags and cloth. The quality of the papers made is now very good, and they have a large and increasing sale. Most of the white and blue foolscap, and much of the blotting paper, note paper, and envelopes used in the Government offices is now obtained from the Indian mills. The total quantity of paper made in 1894 was about 34½ million lbs.; ten years previously it was about 13 million lbs. The value of the out-turn in 1894 is reported at over Rs. 500,000. The number of persons employed is 3,544.

There are a number of small paper works, for the manufacture of what is known as country paper, scattered through most provinces, but of these petty industries no statistical information is available.

### THE RAPID ESTIMATION OF INSOLUBLE PHOSPHATE.

BY VINCENT EDWARDS, F.C.S.

THERE can be no doubt that the estimation of both "soluble" and "insoluble" phosphates in manures is best effected by weight, but at times, when results are required without delay, the volumetric method by means of uranium acetate is extremely useful, and with precautions good results can be obtained, especially with superphosphates and dissolved guanos. This applies, however, more to the "soluble" determination than the "insoluble." In the latter case various substances become dissolved and render the end-reaction with ferrocyanide obscure, and the results therefore untrustworthy. Though I would certainly not advocate the substitution of any volumetric process for the usual gravimetric one, I made a few experiments to ascertain, as a matter of interest, the most suitable conditions under which the "insoluble" phosphate in manures can be estimated by titration with solution of uranium acetate, and venture to submit as the most satisfactory the following:—

I take a small quantity of the well-mixed sample, about 0.5 grm., and exhaust with cold and hot water, collect the undissolved matter as

usual on a small Swedish filter-paper, washing till the filtrate coming through is no longer acid. The residue is then washed off the filter-paper with hot water into a small beaker, and treated with a very small quantity of HCl and boiled on a sandbath for a short time. The hot solution is then run through the same filter into a larger beaker, the sand washed, and the filtrate diluted to 300 c.c., ammonia added till alkaline, and afterwards acetic acid till just acid. The smaller the amount of HCl AmHO and  $\text{H}_2\text{C}_2\text{H}_3\text{O}_2$  employed the better. The beaker is then carefully finished, a deep colour being taken as the end-mark. The results by this method may be a trifle low, but with care will be found very near those by weight. The dilution greatly increases the accuracy of the method, and it is possible that a weaker solution of uranium might be also used with advantage for the "insolubles" than the ordinary one (1 c.c. 0.01 grm.  $\text{Ca}_3\text{P}_2\text{O}_8$ ), and I intend to try some experiments on this point.

Works' chemists, who are often called on to furnish rapid results for home use, will do well to try this plan. I need scarcely say the uranium must be standardised under the same conditions as the titrations are made.

### PRESERVING IRON WITH PAINT.

IN a paper read before the Engineers' Club, of Philadelphia, Messrs. E. A. Custer and F. P. Smith point out how experiments have demonstrated that bright iron does not rust when exposed to a dry atmosphere of pure oxygen and carbonic acid gas, separate or mixed. After the rust has once commenced, only the slightest trace of moisture is necessary to continue this chemical action, which is probably due not only to the corroding influence of the rust already present, but also to its power of absorbing oxygen and condensing moisture. Any covering that is absolutely impervious to moisture will, when applied to clean iron, prevent rust under atmospheric conditions in which corrosive elements are wanting. The protective covering that is to meet these conditions must be cheap and easily applied; and a paint or combination of paints seems to be the logical solution of the problem involved.

The requisites of a good paint for the preservation of iron and steel are stated by Mr. Woodruff Jones to be these: (1) It should firmly adhere to the surface, and not chip or peel off. (2) It must not corrode the iron, otherwise the remedy may only aggravate the disease. (3) It must form a surface hard enough to resist frictional influences, yet elastic enough to conform to expansion and contraction of the metal by heat and cold. (4) It must be impervious to, and unaffected by, moisture and atmospheric and other influences to which it may be exposed.

In undertaking to produce a paint with the above requirements that would absolutely protect iron, it was early determined that the covering should consist of two distinct elements, the first of which should possess the adhesive and elastic properties, and afford a safe and elastic base for the application of a second coating that would be hard, elastic, acid proof, and absolutely impervious to moisture. There is no paint known that will meet the first requirement so fully as good red lead and linseed oil. The dry film of red lead and linseed oil, however, is porous; and this defect must be remedied by a second coating of paint, which will dry with an absolutely impervious and waterproof surface.

It has been justly claimed for red lead that the property it possesses of saponifying the oil—not oxidising it, in its true sense—renders it one of the most valuable pigments for a first coating on structural iron. After numerous experiments, a vehicle was finally selected as affording the nearest approach to an ideal covering for ironwork. The pigment was next considered, and it was decided that this must itself be inert so far as iron is concerned; for while it was intended to be used over a foundation coat of red lead, it should be possible to employ it in some cases as a sole protective covering. A material was incorporated in the pigment which enables it to resist frictional action in the highest degree, and makes it practically impossible to destroy and, to all intents and purposes, absolutely insoluble in any of the known solvents.

One important point that must be carefully considered when the protection of iron is desired is the presence of mill scale or iron rust. No paint, however good, is worth anything for the protection of iron when used over mill scale. The absolute removal of mill scale from the iron before it is painted should therefore be specified and insisted upon. In ordinary practice it has been found sufficient to brush the surface of the iron carefully and thoroughly with a good wire brush, and then apply the paint.

Attention was called to the quality of the paint to firmly adhere to the surface of iron when subjected to very high or low temperatures; and some specimens of pipe were exhibited that were first coated when cold with the protective paint referred to, then subjected to live steam at a temperature of 340°, then painted while hot with the same preparation, and afterwards dipped in a mixture of ice and salt until thoroughly chilled.

## SOCIETY OF CHEMICAL INDUSTRY.

## NOTTINGHAM SECTION.

THE usual monthly meeting of the above section was held on Wednesday evening, the 8th inst., at University College, Nottingham, Mr. F. J. R. Carulla being in the chair. Mr. R. M. Caven read a paper on "Some Properties of Ferric Phosphate," in which he described a number of discoveries in regard to the behaviour of this compound with other bodies. One that throws some light on certain discrepancies that are met with in the analysis of ferric phosphate is its hydrolysis by means of hot water in accordance with the following formula:—

The author also attended to the already known reaction which occurs when ferric phosphate is heated with ammonia, as follows:—

and stated that he had discovered the process to be reversible, so that it could now be written:—

Mr. Caven pointed out that it is worthy of notice that the reaction he had found out was the more easy of the two to bring about, for, as the ammonia evaporated as it was found, the mass of  $(\text{NH}_4)_3\text{PO}_4$  present in the solution rapidly diminished, and greatly facilitated the combination of the iron with the phosphoric acid. The paper, which was illustrated by numerous experiments, was discussed by Mr. Wood, Mr. Meggitt, and the chairman.

Mr. J. T. Wood (the hon. secretary) then exhibited a simple process of silvering glass, showing a splendid 10-inch telescope disc, which he had prepared only the day before. Mr. Wood explained that the process had been described and perfected by the Rev. C. L. Tweedale, so that he could not claim it as original; but the subject of thin mirror films having recently come before the society, he hoped a practical illustration might prove interesting. Mr. Wood took a solution of silver nitrate, strength 1 gram to 20 c.c., to which strong ammonia was added until the precipitate that formed just re-dissolved. A solution of potash was next added, the amount of potash being of exactly the same weight as the silver. The precipitate formed by this new addition was again dissolved by strong ammonia, but not quite absolutely, nitrate of silver being then added till the liquid had a straw colour, or the colour of weak tea. The glass to be silvered was placed horizontally in a shallow dish, and so supported as to be raised, say, half-an-inch from the bottom. Distilled water was poured into the dish until it reached the glass and completely covered the lower surface, viz., the one to be silvered. The glass having been raised out of the way, the silver solution as above prepared was poured into the water, and well stirred with a glass rod. Some solution of pure dextrose was then added, and well stirred in, the glass to be silvered being then replaced. The dextrose slowly reduced the silver to the metallic state, and a most perfect mirror was produced in less than 15 minutes.

Although Mr. Wood was careful to explain the necessity of using pure chemicals, he also proved how this can on occasions be dispensed with by readiness of resource. After the addition of the potash, the presence of silver chloride was very manifest, so that, before proceeding, the precaution was taken to filter the solution. Venus herself could not have wished for a more perfect mirror.

The next meeting is being arranged to take place at Derby on February 5th.

## SCOTTISH SECTION.

The third meeting of the session was held on the evening of Tuesday, the 14th, in the rooms of the society, Bath-street, Glasgow. Dr. John Clark, the chairman of the section, presided. The attendance was of a distressingly attenuated character. The first business was the disposal of the paper read in Edinburgh a month ago, on behalf of Mr. R. Tervet, F.C.S., London, in which some new theories connected with "destructive distillation" were put forth, and the discussion with regard to which had been adjourned. Mr. J. Stanley Muir, the secretary, as the only member present at the preceding meeting, briefly sketched the course of the first section of the discussion. The paper, he said, proved to be very closely technical in character, so much so that those who took part in the discussion did so more as merely interested in the working processes of coal and shale distillation than as inquiries into chemical research, and that because of that the aim of the paper had to some extent missed its mark. When Mr. Stanley Muir concluded his *resumé* of the Edinburgh incidents, Dr. Clark at some length criticised the paper (previously in type, and proofs supplied to members), and the matter was then closed by a vote of thanks to Mr. Tervet, there being no other member who desired to say anything. The remaining business was a paper by Mr. W. Carrick Anderson, M.A., B.Sc., entitled, "A method of obtaining the specific gravity and porosity of coke," and detailing

means he had devised with a view to shortening and simplifying the process hitherto in vogue. After defining the old methods, the paper drew a comparison between the results obtained by these and the results obtained by the new formulae, claiming that by the change the time expended could be reduced from 36 hours to 3½ hours without any detriment to accuracy. Mr. Anderson, in the course of the reading, described a new form of "volumenometer," designed by himself and Mr. J. Stanley Muir, by means of which the specific gravity of solid bodies, whether lighter or heavier than water, could be quickly measured. This new "volumenometer" was exhibited to the meeting, Mr. Anderson explaining that by combining the figures showing apparent specific gravity obtained by means of the new apparatus with the real specific gravity result, the porosity of coke might be accurately deduced. The paper, which proved to be most interesting in character, was well worthy of a larger audience.

## IMPORTS AND EXPORTS FOR DECEMBER.

ACCORDING to the Board of Trade returns for last month things are fairly satisfactory. In the imports there have been larger amounts of petroleum, lubricants, and tallow. The exports of alkali show a falling off in both quantity and value, but there has been a decided increase in soap.

## IMPORTS OF FOREIGN AND COLONIAL PRODUCE.

THE ADULTERATION OF PALM OIL.—At the last meeting of the Liverpool Chamber of Commerce, Mr. J. H. Jackson gave notice that at the next meeting of the committee he would draw the attention of the committee to the subject of the adulteration of produce, especially palm oil and kernels, coming from the oil rivers, and would move a resolution in favour of the issue of Governmental regulations by the Protectorate authorities dealing with the matter.

INJUDICIOUS ADVERTISING.—A "Nervous Old Lady" writes as follows to a London paper to protest indignantly against what seems the latest development of the advertising craze:—"Imagine my dismay last night at being suddenly awakened by a maid, who stood at my bedside with a telegram, lighted a candle, and immediately disappeared. I tore open the envelope; but, alas, without spectacles I could see nothing. I got up in an agony of suspense—having relations in the Transvaal—hunted all over the room for my glasses, and when at length I found them, what do you suppose I read? 'Peter Robinson's sale now proceeding.' Now, sir, I ask you is it not abominable that one should not only be followed from country house to country house by the puffs of wine merchants and coal merchants, but that one should actually be pursued by telegraphic advertisements forwarded by one's servants to the postal (not the telegraphic) address, so that one has to pay miles of portage, and they do not arrive till late at night?"

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

Storing and Purifying Acetylene and like Gases. J. C. Bayley. 320. January 6.  
 Manufacture of Caustic and Carbonate of Soda, and Sulphide of Soda. H. R. Angel. 315. January 6.  
 Separating Cyanogen Compounds from Gas Liquor, etc. H. Bower. 361. January 6.  
 Manufacture of Acetylene Gas. A. Garton. 395. January 7.  
 Smoke Cleansing Apparatus. J. Nemecek and F. W. Keitsch. 425. Jan. 7.  
 Smoke Consuming. W. Smith and T. Lockwood. 527. January 8.  
 Artificial Musk. C. J. Caspers. 525. January 8.  
 Improved Process of Manufacturing Chlorine Gas. J. B. Hilliard. 579. January 9.  
 Stopping and Discharging Device applicable to Carboys. H. J. Gardiner. 647. January 9.  
 Artificial Fuel. H. C. B. Forester. 682. January 10.  
 Obtaining Sulphate of Soda, Hydrogen Sulphide, and Calcium Sulphate from Sulphide of Soda or Calcium Residues and Mono or Bisulphate of Soda. B. Willcox. 720. January 10.  
 Apparatus for Revivifying Spent Limes, etc. G. R. Hislop. 759. Jan. 11.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal and ALL RIGHTS of publication are RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Method of, and Apparatus for Effecting Electrolysis. Dr. C. Kellner, IX. Wasagasse, No. 29, Vienna. Eng. Pat. 24,541. December 17, 1891.

To avoid the difficulty of maintaining an even distribution of mercury over a large horizontal surface, a vertical arrangement is described. It virtually consists of a channel fashioned in helical form round a close-ended stoneware cylinder, the coils of the helix being so arranged that they alternately pass from the outer to the inner side of the cylinder by means of a slit in the latter. A cylindrical anode (which also acts as a store for the solid compound being treated, and with which the strength of the electrolyte is maintained) is placed inside the stoneware cylinder, and connected to the positive pole of the generator. The whole is surrounded by an outer vessel containing the solvent for the cathion. The stream of mercury is connected at various points to the negative pole of the dynamo. In connection with the electrolysis of salt, for instance, the *modus operandi* is as follows:—Salt having been placed inside the anode to fortify the electrolyte which the stoneware cylinder already contains, mercury is run into the topmost inner channel attached thereto. As soon as the circuit is completed the salt is decomposed, forming an amalgam, and flows into the second helical convolution situated on the outside of the cylinder, where, in contact with water, the amalgam is decomposed, and the mercury returning to the third convolution, which is inside, the process begins *de novo*. Escape pipes are provided for the chlorine evolved in the inside of the stoneware chamber, and the hydrogen given off when the amalgam is in contact with water. There are in all eleven drawings, an alternative arrangement better suited to large-scale working being described.

Improvements in Apparatus for Softening and Purifying Water. H. T. Wright, 16, Great George-street, Westminster. Eng. Pat. 3,360. February 15, 1895.

Provision is made for softening water under pressure, without need of further pumping. Part of the water is passed to a tank, in which the chemical precipitating reagents are dissolved, the water as it discharges from the supply pipe actuating a water wheel, which drives a shaft with a stirrer attached. The mixture of water and reagent is then passed up a large cylindrical vessel fitted with inclined baffle plates, which collect the sludge. The clarified water flows away at the top into store tanks, being passed through a filter first, if desirable. There are six drawings.

A Process for Chemically Cleansing Wool and Woollen Fabrics and Rags. E. Lasbordes, of Castres (Tarn), France. Eng. Pat. 3,390. February 19, 1895.

The object is to so treat the wool chemically, as to enable the carbonising process to be effected at a comparatively low temperature. The wool is first passed through a bath of panama wood or hawthorn. It is thus scoured, and also coated with a layer that protects the wool in the acid bath. The latter is prepared by adding enough grey plaster of Paris to 13° or 15° B sulphuric acid, to ensure the removal of all traces of nitric acid, which colour the wool yellow. The solution so obtained is diluted to about 2·5° B. If the wool is very bad 4° or 5° B

will be weak enough. A certain amount of sulphurous acid and bisulphite of soda is also added, and the wool steeped in the acid bath thus prepared. After such treatment, the carbonisation can be effected at 35° to 50° C., the sulphurous acid being oxidised, thereby completing the action of the acid bath. After carbonising the wool is again passed through a bath of panama wood or weak carbonate of soda, which brightens it. Hydrochloric acid can be used instead of sulphuric. The proportions for preparing the baths are given throughout.

Improvements in the Process of Extracting Oil from Vegetable Seed. H. T. C. Kraus, 43, Ralph-street, Brooklyn, U.S.A. Eng. Pat. 27,107. Oct. 25th, 1895.

The seeds after being crushed are passed into a long trough, through which water circulates. The husks are thus floated off, while the kernels sink to the bottom, and are passed by an agitating device to a shoot at the end of a trough. The kernels are then worked in an agitator into a pulp, and run into a heater, where the volatile portions of the seeds escape, and are collected. This product is refined by subsequent distillation, by means of the indirect action of super-heated steam. The products of the distillation are passed through a separator which retains the oily matters, but allows the aqueous portions to pass on to be condensed. There are seventeen drawings in all, many of which are sectional drawings of details.

## THE FERRATES.

BY C. A. O. ROSELL.

IN the course of a paper on this subject the author refers to the question, "Who has first seen ferric acid?" which forms the title of a controversial article in the "J. Prakt. Chem.," wherein is stated that G. E. Stahl discovered that when saltpetre is ignited with iron and the mass is added to water, the caustic alkali resulting from the decomposition of the saltpetre holds a part of the iron in solution and produces an amethyst or purple colour. He also stated that if dilute solutions of iron in nitric acid are poured in successive small portions into a strong solution of caustic potash the iron is dissolved on shaking, with a blood red colour.

While verifying the accuracy of the former (says the author) I have not been able to reproduce the latter of these reactions. On its face it looks so improbable that it must be believed that the statement is erroneous. Probably the nitric acid that Stahl used contained sufficient hydrochloric acid to make the reaction possible. Be this as it may, certain it is that the direction given by Stahl for making potassium ferrate in the dry way, through the ignition of saltpetre with iron, is sufficiently clear to be successfully followed, so that he is undoubtedly entitled to the credit of being the discoverer of ferric acid.

As recently as in Muir and Morley's edition of Watt's Dictionary of Chemistry, page 547, it is stated that "Stahl noticed in 1702 that a violet solution is obtained by fusing iron with saltpetre and washing with water or by adding a solution of iron in HNO<sub>3</sub> to conc. KOH aq.," which shows that these two editors had nowhere found a correction of the erroneous statement of Stahl, nor has a correction been published by any one until now.

In 1802 potassium ferrate was rediscovered by Ekeberg, while fusing gadolinite, which is a silicate of yttrium, beryllium, and iron, with caustic potash. In this experiment the ferric oxide, of which the gadolinite contains 16 per cent., was oxidized in the presence of caustic potash so as to form potassium ferrate. However, neither Stahl nor Ekeberg examined the character of the iron compound which resulted from the reaction with the caustic potash, either added or produced in the process, and which gave rise to the claret colour observed.

When Fremy undertook an investigation of those compounds of the metallic oxides, in which the latter play the part of acid metallic anhydrides, he very soon rediscovered the solution of ferric oxide in caustic potash. In this solution he found that the oxide did not exist as ordinary ferric oxide, Fe<sub>2</sub>O<sub>3</sub>, but that it contained more oxygen than the latter, the quantity of oxygen contained corresponding roughly, or as closely as it was possible to analytically determine the constitution of an impure and somewhat variable body, such as barium ferrate, to the formula FeO<sub>3</sub>, a result which has since been confirmed by J. Denham Smith and H. Rose.

The accounts of Fremy's work were published from time to time in a number of scientific periodicals, commencing with January, 1841, when he states that the compound of oxide of iron and potash which is soluble in water corresponds in composition to the manganates, and in 1842 the new compound was called by him ferric acid, though the name had already been suggested by J. Denham Smith in Phil. Mag. Ser.

Besides producing potassium ferrate by the methods of Stahl and Ekeberg, which were unknown to him, Fremy also obtained it by electrolyzing caustic potash with an anode of cast iron and also by introducing chlorine into a solution of caustic potash containing ferric hydroxide in suspension. In addition he produced this salt by heating iron with potassium dioxide.

In attempting to produce sodium ferrate by such processes as Stahl and Ekeberg had used to produce potassium ferrate he failed. Not only did Fremy fail in his attempts to produce sodium ferrate in the dry way, but there is not to be found in the literature of the subject any account of anybody else who has succeeded in doing so or who has ever suggested the possibility of its being accomplished. In fact, the statement occurs in chemical literature that sodium ferrate cannot be made except in the wet way. Thus in Wurtz' "Dictionnaire de Chimie," Volume I., part 2, page 1413, the following is found: "Sodium ferrate is soluble in water and cannot be prepared except in the wet way."

Bloxam prepared a solution of sodium ferrate by adding bromine to a strong solution of caustic soda containing ferric hydroxide in suspension. This I have found a very quick and convenient method of producing a small quantity of a solution of sodium ferrate. I have also several times made the attempt to produce sodium ferrate by the addition of iodine to a solution of caustic soda holding ferric hydroxide in suspension, but no sodium ferrate was formed.

Bloxam also found that a solution of calcium ferrate may be produced by gently heating a solution of bleaching powder with a small portion of ferric chloride. On repeating this experiment I have found the process to be a very delicate one, and that it often fails, although, if very carefully conducted a rose-red solution of calcium ferrate is formed. I thought that perhaps by the addition of lime to the bleaching powder solution the reaction might take place more expeditiously. Such, however, was not the case, as a solution of calcium ferrate could never be produced when lime was first added to the bleaching-powder solution containing a small portion of ferric hydroxide in suspension.

It was first stated by Fremy, and it has subsequently been repeated in the text-books, that calcium ferrate, like barium ferrate, is insoluble in water. The experiment of Bloxam above referred to shows that this statement is not correct.

On preparing a solution of sodium or potassium ferrate allowing it to stand, it sometimes changes colour from red to green. J. Denham Smith believed this green solution to be caused by some new iron compound, but Heinrich Rose showed that it was derived from manganese. The ferrate solution prepared contained a manganate. On standing, the ferrate decomposed while the manganate remained unchanged until at last only manganate remained, when the solution turned green. I have repeatedly verified the correctness of Rose's explanation.

In undertaking a course of investigation of the properties of ferric acid the following interesting problems presented themselves:

1. Production of sodium ferrate in the dry way.
2. Production of iron dioxide.
3. Decomposition of barium ferrate by metathesis so as to obtain in this way a normal ferrate containing no free alkaline hydroxide.
4. Determination of the constitution of the thioferrates.

#### PRODUCTION OF SODIUM FERRATE IN THE DRY WAY.

In the attempts to produce sodium ferrate in the dry way, ferric oxide, both dry and hydrated, was calcined with caustic soda, sodium carbonate, sodium nitrate, and with mixtures of sodium hydroxide and nitrate, and also with sodium nitrate and carbonate, but all in vain. The substitution of sodium chlorate for a part or all of the sodium nitrate was also tried, but with no change in the result. Sodium dioxide was then tried, but at first without success. It was, however, observed that when the fused mass from this last experiment had been allowed to cool, on subsequent addition of water it became highly heated, and it was suspected that while sodium ferrate had been produced by the reaction, that it was at the same time decomposed by the heat, resulting from the addition of the water, and it was believed that if this rise in temperature could be obviated the decomposition of the ferrate might be prevented. This theory was acted on, and the mass resulting from the fusion of the ferric oxide and the sodium dioxide was treated with ice, and though some rise in temperature still followed it was much less than before, and sodium ferrate was obtained in solution. Thus the first problem had been successfully solved, and sodium ferrate was for the first time produced in the dry way. There are two probable reasons why Fremy failed. In the first place, when using sodium nitrate this was to a great extent decomposed by the heat leaving behind sodium nitrite which is stable at high temperatures, and which, when the mass was dissolved in water served as a reducing agent, reducing the iron trioxide to the ordinary ferric oxide, while the nitrite itself, by oxidation, became converted into nitrate. When using caustic soda the cause of the failure was probably the heating of the mass on the addition of water, which heating has already been referred to.

#### ATTEMPTED PRODUCTION OF IRON DIOXIDE.

The production of iron dioxide was of course the most important of the problems. The hope of accomplishing this result was the inciting cause of the investigation, and a great number of experiments were conducted with this end in view.

As it is well-known that chromium dioxide can be readily obtained by adding a solution of a chromic or chromous salt to a chromate it

would seem at first sight that, having the iron monoxide and the trioxide, the iron dioxide might be easily prepared by an analogous reaction to the one above-mentioned.

To produce a precipitate of iron dioxide from a solution of sodium ferrate, which is highly alkaline, the solution of the iron salt added would have to be alkaline. Such a solution may be made in many ways, such as by the addition of tartaric acid, citric acid, or glycerol, to a solution of a ferric salt and then adding a caustic alkali in excess, but in each case the organic solvent was oxidized before any precipitate was formed, and so this method had to be abandoned.

The addition of barium ferrate to solutions of ferric chloride, both normal and basic, was tried with apparently good prospects of success as the barium went into solution as chloride, but at the same time oxygen and also chlorine were given off, so that the precipitate ultimately obtained consisted merely of ordinary ferric hydroxide. For the purpose of this experiment, the barium ferrate was just as good as normal sodium ferrate, could this latter be produced; the barium ferrate decomposed the ferric chloride perfectly, so that if iron dioxide is capable of production, here the conditions of success seemed to be the best, and yet the result of the reaction was only ordinary ferric oxide. Hence it is quite certain that if iron dioxide can be made at all, it is a compound of such exceeding instability as to be decomposed as fast as formed.

#### THE REACTIONS OF BARIUM FERRATE.

Of the ferrates the most stable, the one that can be prepared in the purest state and the most definite in composition is barium ferrate,  $\text{BaFeO}_4 \cdot \text{H}_2\text{O}$ , this formula having been determined by Fremy and H. Rose. Before barium ferrate has been allowed to dry in a desiccator it is not so easily decomposed, at least completely. If barium ferrate, which has not been allowed to dry, be suspended in water through which carbon dioxide is passed, it will be completely decomposed with the formation of barium carbonate and ferric hydroxide, oxygen being set free. From this decomposition it might reasonably be expected that iron dioxide would be formed just as manganese dioxide is formed on passing carbon dioxide through water containing barium manganate in suspension, but such is not the case. This experiment would also seem to indicate that neither a compound of iron corresponding to a permanganate nor a compound corresponding to a bichromate exists. The result of passing carbon dioxide through water containing barium ferrate in suspension, with the object of obtaining new iron salts, therefore carries with it two disappointments.

When barium ferrate has been thoroughly dried in a desiccator it is readily attacked by acids, but complete decomposition is not readily effected in the cold even with dilute sulphuric acid, oxalic acid, formic or acetic acids. Hydrochloric acid decomposes it completely with the greatest readiness, chlorine being always set free. If barium chromate be digested with a solution of sodium ferrate, barium ferrate is formed and the solution changes colour from red to yellow, due to the sodium chromate which has been formed. The reverse reaction never takes place. Thus, if barium ferrate is digested with a cold solution of an alkaline carbonate, sulphate or triphosphate, an alkaline ferrate is never formed, the solution remaining colourless. An alkaline sulphate will decompose barium ferrate that has not been dried with the formation of barium sulphate and ferric hydroxide, oxygen being set free. It thus appears that barium ferrate is one of the most insoluble salts known. It is strange that in none of the publications up to this time has the behaviour of barium ferrate to neutral salts been referred to.

#### THIOFERRATES.

Fremy states that on passing hydrogen sulphide through a solution of sodium ferrate a solution is obtained of a beautiful emerald colour. He supposed that the sodium ferrate was converted into sodium thioferrate. On passing hydrogen sulphide through a solution of sodium ferrate I sometimes obtained the green solution described by Fremy, and at other times not. Investigating the matter, I found that the green solution was obtained only when the original solution contained manganese. It appears then that on passing hydrogen sulphide through a ferrate solution containing a manganate the ferrate is reduced by the hydrogen sulphide, leaving the green manganate solution behind. If, on the other hand, the ferrate solution contains no manganese on passing hydrogen sulphide through it, the red colour disappears and a solution is obtained having a greenish yellow tinge, such as is obtained by digesting precipitated iron sulphide in a solution of an alkaline polysulphide, the greater part of the iron being precipitated as black sulphide. The supposed thioferrates must therefore be considered as mythical.

The only use so far suggested for the ferrates is the production of oxygen described in British Patent, No. 85, January 10, 1886, to Brooman, a communication by Maréchal and Tessié du Motay, in which it is stated that potassium, sodium, and barium ferrate may be decomposed by a current of steam, and subsequently reformed by the action of a current of air at high temperature.

Whether the ferrates resemble the chromates or manganates more is difficult to say. If a salt could be produced corresponding either to the bichromates or the permanganates, the question would of course be immediately decided. The extreme insolubility of barium ferrate, together with the solubility of calcium ferrate, as well as the instability of the dioxide, if it does exist, brings the ferrates closer to the chromates than the manganates. On the other hand, the soluble ferrates can only exist in alkaline solutions, and in this respect they resemble the manganates. In their oxidising power the ferrates still more closely resemble the manganates. It has already been stated that a ferrate will oxidise nitrites, tartarates, and glycerol. The soluble ferrates are also decolorised or reduced by oxalates, alcohol, ether, ammonia, urea, and other soluble organic bodies with very few exceptions, such as, and notably, the acetates. They are decomposed also by some insoluble organic bodies, such as paper and insoluble carbohydrates, but most insoluble organic bodies, such as the paraffines and benzene, decompose them but very slowly.

To perform all the experiments on ferrates above referred to, sodium and potassium ferrate had often to be prepared. Of all the methods of making these salts the easiest is to pass chlorine through a strong solution of sodium hydroxide, containing ferric hydroxide in suspension. At one time I produced sodium ferrate on a scale never before attempted. Three kilos of sodium hydrate were dissolved in enough water to form 10 litres of solution. To the solution were added 150 grams of ferric chloride, and the mixture stirred for a long time until the ferric hydroxide formed was all finely divided and evenly distributed throughout the solution. Through the mixture chlorine gas was then passed from a cylinder of liquid chlorine which had kindly been presented by my friend, Dr. Rudolph Knietzsch, one of the leading chemists of the Badische Anilin und Soda Fabrik, of Ludwigshafen, Germany. The operation was carried on very successfully, the chlorine gas passing through with great regularity, and in this manner a quantity of stock solution was prepared sufficient for all subsequent experiments.

It may here be stated that whenever an experiment is described above it has been actually tried for the purpose of making sure that the reaction indicated actually takes place.

The following is a summary of the errors which occur in the literature of ferric acid:—

1. The direction for making potassium ferrate by adding iron nitrates to caustic potash, by Stahl.
2. The statement that on standing a solution of potassium ferrate changes colour and turns green, made by J. Denham Smith.
3. The statement that calcium ferrate is insoluble in water, made by Fremy.
4. The direction for making thioferrates by passing hydrogen sulphide through a solution of a ferrate, by Fremy.
5. The allegation that sodium ferrate cannot be made except in the wet way, made by Wurtz.

Of these the second error was corrected by H. Rose, and the third by Bloxam, the other three having now for the first time been brought to light.

## Trade Notes.

**THE NEW TAMARUGAL NITRATE COMPANY, LIMITED.**—This company announces that £3,600. of its six per cent. debentures have been drawn, and will be paid off at £105. per cent. at Williams Deacons and Manchester and Salford Bank, Limited, 20, Birchin-lane, London, E.C., on February 1st, when the interest thereon will cease.

**MESSRS BERGER, KAHLER, AND CO.**—We are informed that this firm, in addition to being sole agents for the United Kingdom and Colonies for Messrs. Koenigswater and Ebell, of Linden, are also now agents for the Anhaltische Blei und Silberwerke, who make white sugar of lead, &c.; the Continental Farbwerke (Bernhard Fischer), makers of colours for soapsect, and for Messrs. Freidr, Fenstell, Nachfolger, Hamburg, for the sale of their essential oils, &c.

**WATERFALLS AND ALUMINIUM WORKS.**—The estate of Hafslund, near the great waterfall known as the Sarpsfos, between Christiania and Göteborg, has been acquired by a syndicate, consisting chiefly of German and American capitalists, for the sum of 800,000 kroner. The purchasers intend to form a large company with a capital of three to five million kroner, in order to utilise the water power of the falls for electrical force, and establishing aluminium works on the same principle as those now being constructed at the Falls of Foyers in Scotland. The Sarpsfos is one of the finest falls in south-eastern Norway, being 74 ft. in height and 116 ft. in width. The water power is, however, already utilised by numerous saw mills and cellulose factories, and the railway crosses the fall, so that the proposed new works will probably not interfere to any great extent with the picturesque aspect of the place.

**END OF THE OIL AND PARAFFIN COMBINE.**—The meetings that have been held in London and Glasgow during the last few days have, as we anticipated, proved futile, and it is now generally accepted that the Scotch oil and scale combine is practically ended. The Clippen's Company has intimated that owing to the abandonment of the arrangement with the American Company, they will conduct their business with a free hand.

**MANCHESTER PITCH EXPORTS.**—The exports of pitch from Manchester, via the Ship Canal, are steadily growing in volume, the markets at present being Swansea, St. Nazaire, and the South of France. The trade to the first-named port is done mainly by small coasting sailers and steamers which bring pottery material to Runcorn, Ellesmere Port, and Weston Point. A full cargo of pitch left Manchester recently for Cette by the steamer *Brunla*, 425 tons, and it is stated that the Ship Canal Company are about to provide improved facilities for this traffic.

**NITRATE STATISTICS.**—According to recent returns relating to nitrate of soda it appears that the production in December was about 119,000 tons, making the year's output 1,300,000 tons, of which 1,210,000 tons have been shipped. During the past fortnight the open and favourable weather has made the arrivals in Europe very large, and this, with the further hitch in the Combination negotiations, caused a depression in prices, from which the market is just recovering. The negotiations are said to have come to a standstill over so small a matter as 10,000 tons, or less than 1 per cent. of the amount to which it was proposed to restrict the year's shipments.

**LOGWOOD IMPORTS AT MANCHESTER.**—Two barques laden with logwood from Laguna arrived in the Mersey recently, viz., the *Ida*, 284 tons, which left Queenstown on the 7th inst., and the *Mayaguez*, 341 tons which left Falmouth on the 8th. Both vessels entered the canal and will discharge their cargoes in Manchester. The growth of this trade is indicated by the fact that, in addition to the two above mentioned, there are at present six barques discharging cargoes of dyewoods at Trafford Wharf, Salford Quay, and the Salford Docks, namely, *Ruth*, 451 tons, *Vallejo*, 652 tons, *Cubana*, 471 tons, *Giovanni*, 440 tons, *Hugin*, 391 tons, and *Edith Mary*, 304 tons. Further cargoes are fixed by the *Spind* and *Haveskes II.* from Jamaica, and *Liburnia* and *St. Olaf* from Savannah-la-Mar.

**DANGEROUS PARAFFIN LAMPS.**—The *Lancet* publishes a long report of the commission appointed by that journal to inquire into the subject of dangerous lamps. The essential points of construction in a paraffin lamp are, according to the observations made in the investigation, as follows: "1. The reservoir should be of metal or non-fragile material. It should be fixed firmly in the base, and not rest loosely as is the case with many beautiful and artistic lamps in a cup-shaped stand. 2. The lamp should have a base heavy enough to minimise the risk of upsetting. 3. The burner should be connected to the reservoir by a screw with well-cut thread, requiring at least three entire turns before it becomes detached from the reservoir. It should be made tight to the reservoir by means of a washer. Bayonet joints, or pin-and-slot joints, not to say the mere fitting on of the burner like a cap on the mouth of a reservoir, should be prohibited. 4. The wicks should be constructed of material of good quality and should fill the space of the wick-tube. The wick should be replaced by a new one as soon as it gets worn and diminishes in size. Circular wick tubes should never be fed by a flat wick the edges of which are not likely to close up in the wick tube. The wick in these cases should be a complete cylinder. 5. The wick tube should be made to descend into the reservoir within at least a quarter of an inch of the bottom. Assuming the screw of the burner to be free from defect, it would then be impossible for oil to escape—the source of most of the danger of paraffin lamps, nearly all of which have their wicks hanging unguarded in the reservoir. This arrangement would also render it impossible for the flame to travel into the reservoir space." This is very interesting and desirable, but the *Lancet* should finish its task by pricing such a lamp. It all depends on that.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are steady at 2s. 3½d. for 90's and 2s. for 50/90's. Carboic acids are firm, makers being well booked with orders: Crude (60%) stands at 1s. 9½d., and 40% crystals 6½d. Crude naphtha firm at 10d. and solvent 1s. 6d. Creosote unaltered. Anthracene 11½d. to 1s. for 30% A, and 9½d. to 10d. for B. Pitch easier at 36s., f.o.b., East Coast.

Sulphate of ammonia is weak; the feeble state of the market being largely due to the free selling being practised by London makers. There is, however, a rather steadier feeling at the close, with prices as follows:—London outside makes £8. 10s., Liverpool £8. 7s. 6d. to £8. 8s. 9d., Hull £8. 8s. 9d., and Leith £8. 8s. 9d. Beckton value for February-March is £8. 10s., less 2½%. Old Beckton terms £8. 7s. 6d., this being an advance of 2s. 6d. on Thursday's price.

## LIVERPOOL MINERAL MARKET.

There has been a fair business done this week, and good prices have been obtained. Manganese: There have been several arrivals, most of which have been against contract purchases, and have gone direct to consumers' works, so that spot remains practically unchanged, with a tendency to stronger prices. Ground manganese: With the improvement in the price of the raw ore, prices are tending to strengthen; the demand is good at £6., £8., £10., and £12. 10s. per ton, according to quality. Manganiferous iron ore is unchanged at 16s. to 17s. 6d. per ton, c.i.f. Chrome ore: There have not been so many arrivals this week, but the demand keeps strong, and prices are firm at 70s. to 100s. and 105s. per ton, according to quality. Bauxite: There has been more demand for bauxite this week, and prices keep firm at 20s. per ton for first, 16s. for second, and 12s. per ton for third quality, f.o.b., in cargoes. French chalk: There have been several arrivals, but the consumption keeps ahead of the supply, and prices for "Angel White" brands are tending to advance—70s. to 75s., 80s. to 90s., and 100s. to 110s. per ton, according to grade. Wolfram and scheelite have been in increased demand this week, and sales have been made at good figures. Arsenic is scarce at £17. to £19. per ton. Fuller's earth is in good demand, and prices for "Emerald" and other brands continue steady at 50s. for lump, 55s. to 75s. for powdered. Rottenstone is scarce, and prime quality brings good prices; sales are being made at £8. 10s. to £15. per ton, according to grade. The market for ochres and umbers remains steady; there is a fair demand for J.C. ochre at 60s. to 65s. per ton, and prime umber is being done at 40s. to 45s. per ton. Carbonate and sulphate of barytes are practically unaltered. Feldspars and fluorspars remain unchanged, a fair business being done. Emery stone is in rather better request. Plumbago: The demand is very good for foundry and lubricating qualities, at £5. to £10. per ton. Ceylon qualities have been in better demand this week, at prices from £15. to £20. per ton. Pumice stone: The finer grades are very firm, and bring good prices. Iron ore is quiet, and remains without change, at about 10s. per ton.

## THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, dull: Scotch warrants closed at 46s. 5d.; Middlesbrough, 37s. 6½d. cash, and hematite, 47s. 6½d. Copper, firm: Chili bars, G. O. B.'s and G. M. B.'s closed at £41. 3s. 9d. to £41. 8s. 9d. cash, and £41. 11s. 3d. to £41. 16s. 3d. three months. Tin, easier: Straits closed at £59. 7s. 6d. to £59. 17s. 6d. cash, and £60. to £60. 10s. three months. Australian, £60. 2s. 6d.; English ingots, £63. to £63. 10s. Lead, firm: Spanish, £11. 2s. 6d.; English, £11. 5s. to £11. 7s. 6d.; Silesian spelter, ordinary, £14. 5s. Nickel, 1s. 2½d. Antimony, £30. Quicksilver: first hands, £7. 7s. 6d.; second hands, £7. 5s. Copper shares, steady: Cape, 2 to 2½; Copiapo, 1½ to 2½; Libiola, 2½ to 2¾; Mason and Barry, 2¾ to 2½; Rio Tinto, 16½ to 16¾; Tharsis, 4¾ to 4¾.

GLASGOW, WEDNESDAY.—Market easier, with large business. Scotch done at 46s 6½d. and 46s. 5½d. cash, also at 46s. 8d. and 46s. 7½d. one month; closing with buyers at 46s. 5d. cash, sellers ask 46s. 5½d. Cleveland done at 37s. 7½d., 37s. 6½d., and 37s. 7d. cash, also at 37s. 9½d. and 37s. 8½d. one month; closing with buyers at 37s. 6½d. cash, sellers ask 37s. 7½d. Cumberland hematite done at 47s. 10d. and 47s. 9½d. one month; closing with buyers at 47s. 6½d. cash. Middlesbrough hematite done at 45s. 9d. and 45s. 8d. one month; closing with buyers at 45s. 5½d. cash.

## MISCELLANEOUS CHEMICAL MARKET.

There is no change of any importance to record in the situation of alkalis. Ammonia soda is firm at the price fixed by the combined makers, viz., £3. 7s. 6d. nett per ton, bags, f.o.r. works, and £3. 12s. 6d. casks, f.o.b. Caustic soda all round in steady demand, and prices are maintained, quotations for spot and forward delivery being as follows:—F.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 10s.; 70%, £7. 10s.; 60%, £6. 10s. nett per ton, 10-ton lots and upwards. Leblanc soda ash is only in limited request, but makers hold for 1d. per degree for ordinary grades and 1¼d. for refined qualities. Bleaching powder is in active demand, and market firm at £7., makers' works, and £7. 5s. to £7. 7s. 6d. f.o.b. Liverpool. Chlorate of potash has slightly advanced, 4¾d. to 4¾d. being nearest values to-day. Chlorate of soda unchanged at 6½d. per lb. Soda crystals quiet at 35s., bags, makers' works. Vitriol in strong request. Sulphur well sold, but no improvement in price. The demand for sulphate of copper has somewhat fallen off, price £15. 10s. to £15. 15s. f.o.b. For potash, caustic and carbonate, there is good inquiry, and prices are firm. White powdered arsenic in short supply, and for spot parcels £16. 15s. to £17. per ton is obtained. Yellow prussiate of potash

7¼d. to 8d., according to make. Brown acetate of lime has declined a further point in value, owing to large stock. Other acetates are all selling at low figures. Acetate of lead decidedly quiet, and price has a lower tendency. For carbolic crystals price is steadily maintained. Aniline oil and salt are also firmly held for advanced prices. Generally, trade is reported quiet.

## TYNE CHEMICAL REPORT.

TUESDAY.

The chemical trade is quiet, with little or no alteration in prices. 76/77% caustic, £9. 5s.; 70%, £7. 10s. to £7. 15s. per ton. Sulphur scarce at £3. 17s. 6d. per ton. Soda crystals, £2. 2s. 6d. per ton, gross weights, locally. Other quotations as under:—

Bleaching powder, softs, £7. 5s. per ton, nett; hard, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30 per ton, nett.

SALT.—South Durham salt is steady at 9s. to 9s. 6d. per ton, f.o.b., Tees.

COALS.—There is very little alteration in the price of coals. Gas coals continue in full demand and are firm in price. There is also a rather better demand for coke. To-day's quotations are:—Best Northumbrian steam, 7s. 9d. to 7s. 10½d. per ton; second qualities, 6s. 9d. to 7s. per ton; small steam, 3s. 6d. to 3s. 9d. per ton; household coals, 10s. 6d. to 11s. per ton; gas coals, 7s. to 7s. 6d. per ton coke, 14s. 6d. to 15s. per ton.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

The outstanding feature in the Scotch market this week is the definite break up of the Solid Paraffin Combine, initiated just about a year ago, and long very sickly. The adjourned meeting of the Scottish producers was held in Glasgow yesterday, when it was seen that the agreement was finally doomed; and delegates parted on the understanding that each maker was to sell at whatever reduction he pleased. The undernoted figures (for paraffin scale and paraffin wax) are permitted to stand this week at the Combine rates, but these articles are probably procurable at one halfpenny per lb. less, although no transactions are as yet on report. The other products of the mineral oil section are unchanged. Sulphate of ammonia is quite neglected, and the figures given below are thus merely nominal. In the general chemicals market there is observable a slightly firmer tendency perhaps, but the improvement is as yet of the faintest. Speculative inquiry, both for home and foreign destination, is a little more in evidence than it was a week ago.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. 10s. nett, Glasgow; caustic soda, white, 76° £9. 5s., 70/72° £7. 10s., 60/62° £6. 10s., and cream 60/62° £6. 10s.; all nett, Liverpool; bleaching powder, £6. 15s. to £7. 5s. nett, Tyne; saltcake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¾d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4¾d. less 5%, Liverpool; nitrate of soda, 7s. 7½d. to 7s. 10½d.; sulphate of ammonia, £8. 10s. to £8. 11s. 3d. prompt, f.o.b. Leith; salammiac, first and second white, £39. and £37. nett, any port; sulphate of copper, £15. 12s. 6d. to £15. 15s., less 5%, Liverpool; paraffin scale, hard, 2½d., and soft, 1¾d. to 2¾d. per lb.; paraffin wax, 120° semi-refined, 2¾d. to 2¾d.; paraffin spirit (naphtha), 7½d. to 8d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6¾d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £4. 15s. to £5., 885° £5. 5s. to £5. 10s., and 890/895° £5. 10s. to £6. 10s. Week's imports of sugar at Greenock were 30,500 bags beet unrefined.

## REPORT ON MANURE MATERIAL.

The market is still very quiet, and the tendency of prices is rather in favour of buyers. Quotations for mineral phosphates are unchanged. On the one hand they do not seem to admit of any further reduction; on the other hand manure makers seem determined not to go in for further extensive purchasing until they can form some opinion as to how the coming manure season will turn out. There is nothing fresh to report in River Plate bones, and the nominal value of cargoes afloat is still about £3. 15s. per ton. Crushed Kurrachee bones offer at £4. per ton, ex store, without finding buyers. Further business in Bombay bone meal has been done for January-February shipment, at £3. 16s. 3d per ton, ex quay, and this price would still be accepted. Common grinding bones are worth £3. 10s. to £3. 15s., as in quality and condition. Nitrate of soda is a shade easier on spot, there being sellers of ordinary quality at 7s. 6d. per cwt., in quantity. For fine quality 7s. 7½d. to 7s. 9d. still required. Due cargoes are, perhaps, a shade firmer, and 7s. 6½d. per cwt. is nearest value. Home prepared dried blood offers at 7s. 6d. per unit, delivered free to rails at works.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

**OILS.**—Owing to the small quantity offering, palm oil is steady, but there is not much business doing. About 50 tons of Lagos have been done at £20. 5s. transit. There is no change in olive. Linseed are being steadily held for 20s. 6d. to 21s. per cwt., Liverpool makes, in export casks, but things are rather quiet. There is a rather firmer tone in cottonseed, and the market is steady. Liverpool refined is quoted 17s. 9d. to 18s. per cwt., in export barrels. Castor oil is steady, good seconds Calcutta offering at 2½d., and first pressure French at 2½d. per lb. Owing to the improved enquiry for tallow, the market is firmer, and prices steadier. Low grade rosin continues in good demand at full prices, but as the values of the higher qualities are unaltered, there has been a falling off in the demand. There is a fairly good business doing in spirits of turpentine, which are now being firmly held for 21s. 6d. per cwt. spot. Petroleum steady and unaltered:—American, 7d. to 8½d.; and Russian refined, 6½d. per gallon.

**COLOURS** are steady, without alteration in prices. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

**OILS.**—The oil trade is being well maintained, with few variations in price; yet upon the whole prices are better. The imports up to date, compared with the same period of last year, have been:—Linseed, 46,546 quarters, against 13,642 quarters; rapeseed, 1,210 quarters, against 12,718 quarters; cottonseed, 17,139 tons, against 14,132 tons; olive oil, 451 casks, against 904 casks; rape oil, 211

casks, against 409 casks; oil cakes, 1,910 tons, against 1,323 tons; tallow, 2,756 cwt., against 1,199 cwt.; turpentine, 2,612 barrels, against 2,967 barrels. Linseed oil, after declining 5s. per ton, closes firm at 19s. to 19s. 1½d. on the spot; February-April and May-August deliveries offer at 18s. 9d.; boiled and refined from £1 to £2. per ton extra. Export for week, 680 cwt. Refined cotton oil has improved about 7s. 6d. per ton, closing firm at 15s. 1½d. to 15s. 3d. naked; February-April is quoted 15s. 6d., and May-August 16s. 3d. per cwt. Crude upon the spot is quoted 13s. 6d. naked. Export of refined for the week, 4,060 cwt. Casks are quoted £1. per ton and barrels 30s. per ton extra. Olive oil unchanged. Castor oil is steady. Spirits of turpentine, 22s. 3d. per cwt. Cod oil from £16 10s. to £19. per ton. Neutral liquid soap, £16. per ton. Mineral oil continues scarce and enhanced in values. Sweet fat, £26. per ton, Locomotive grease, £12. per ton.

**CAKES.**—Linseed cakes in moderate request; prices firm: 95% pure, £6. 5s.; Russians, £5. 17s. 6d. Oil cakes, £5. 2s. 6d. to £5. 5s. Cotton cakes quiet; best makes, £3. 13s. 9d.; seconds, £3. 10s. Rape cakes: Black Sea, £2. 7s. 6d.; East India, £3. 7s. 6d. per ton.

**PAINTS.**—Trade continues good. Prices are:—White lead, red lead, and oxide of zinc unchanged. Dry mineral colours from £3 10s. to £8. per ton. Ultramarines, 3d. to 8d. per lb.; black, blue, red, oxide, green, and venetian red paints from £11. per ton. Ready-mixed paints, in lever tins, from £24 per ton. Paint remover, 25s. per cwt. Natural dubbin, for belts, etc., 12s. per gallon. Oak varnish, 5s. 6d. per gallon. Black varnish, £5. 10s. per ton, in barrels.

## New Companies.

**Pure Oil Co., Ltd.**—CAPITAL, £5,000., in £10. shares. This company has been formed to acquire the business of the Pure Oil Co., Neasden, Middlesex, and to deal in and sell oils, lamps, etc.

**Automatic Soap Co., Ltd.**—CAPITAL, £1,000., in £1. shares. This company has been formed to carry on the business of manufacturers, packers, and dealers in soap, starch, blue, and all other laundry requisites.

**F. J. King and Co., Ltd.**—CAPITAL, £50,000., in £10. shares. This company has been formed to acquire plant, etc., for the production of dessicated soup and preserving potatoes. The subscribers to the memorandum of association are:—W. Wilson, Brablock, Paisley, manufacturer; J. Sutherland, Arden, Bothwell, manufacturer; W. Chaine, Larne, co. Antrim, gentleman; D. Macdonald, Larne Harbour, co. Antrim, C.E.; J. McDowell, Larne Harbour, co. Antrim, secretary; C. H. Brett, 9, Chichester-street, Belfast, solicitor; A. E. Brett, 9, Chichester-street, Belfast, solicitor.

## Gazette Notices.

## PARTNERSHIPS DISSOLVED.

W. HARTLEY and H. SPEAK, dyewood cutters and grinders, Huddersfield, under the style of H. K. Beaumont and Co.

S. H. MATHER, J. ORMESHER and C. MATHER, Middleton and Manchester, dyers and polishers, under the style of Mather, Ormesher and Co., so far as regards S. H. Mather.

M. A. RAGG and E. RAGG, dyers, Birmingham and West Bromwich, under the style of W. and S. Wragg & Son.

## INDEX and TITLE PAGE for VOL. XVII.

WILL BE ISSUED WITH NO. 457, FEBRUARY 22, 1896.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

Readers will oblige by making their remittances for subscriptions by Postal or Post Office Order, crossed and payable to "Davis Bros."

Articles, reports, and correspondence on all matters of interest to the Chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

10 Words and under..... 2s. 6d. per insertion  
Each additional 10 words ..... 6s. 6d.

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

30 Words and under ..... 1s. 6d. per insertion.  
Each additional 10 words..... 6s. 3d. "

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff rates, which will be forwarded on application.

Advertisements intended or insertion in the current week's issue should reach the office by Thursday morning at the latest.

## CURRENT TOPICS.

### THE DANGERS OF IGNORANCE.

FROM time to time accidents happen which bring out strikingly the serious danger which attends "gassing," and we have again quite recently had two cases in which no less than eight lives have been lost, mainly owing to the ignorance which appears to prevail about the best method of dealing with such cases, or trying to effect a rescue. To those who have given attention to the matter, it must be somewhat wearying to read the same description for every accident, even though there is a lapse of some months between each. To take the recent accident at Tynemouth, which occurred while the purifying boxes at the gasworks were being cleaned. One man enters the box, and is overcome by sulphuretted hydrogen. A comrade at once follows, to give assistance, and he, too, falls a victim. In the same way six men essay, and fail, and then—and then only—the usual alarm is raised, and medical aid called in. Steps are taken to clear the room or building from sulphuretted hydrogen, as the case may be, and then artificial respiration is resorted to, in the case in point with limited success, for three only out of the eight who were overcome were revived. In the Widnes case two men were overcome in a sewer, and a third man who went to their assistance was likewise rendered insensible. Their deaths were only indirectly due to the sulphuretted hydrogen, as, when they were overpowered, they appear to have fallen into the water in the sewer and been drowned before they could be rescued.

After what we have said in the past about the use of the oxygen bottle in cases of "gassing," we are somewhat curious to know whether in the Tynemouth instance the remarkable power of oxygen in restoring respiration was made use of. If it was not, it is high time the medical profession were put through a course of "technical education." It is indeed in this connection that technical education is most painfully wanted, and would be really useful. The ignorance which prevails is really astonishing, and although much has been done to increase our knowledge of the best way of treating those who have been "gassed," little of the knowledge seems to have found its way into practice. Just now we have a very well-meaning committee actively engaged in inquiring into the dangers attending occupation in chemical and other works, and the results of the last two days would indicate that there was greater need for attention to the "other" than to the chemical works, for although there is ample room in the chemical trade for advancing the spread of knowledge regarding the treatment of gaseous poisoning, it seems that the majority of those connected with chemical works are highly educated in these matters when compared with the striking ignorance which is being constantly revealed in other industries. Though we are inclined to think that many of the so-called dangers of chemical works are un-

warrantably exaggerated, we are perfectly open to admit that "gassing" is one of the most formidable risks which attend occupation in the chemical trade. Those who have never witnessed the effects of sulphuretted hydrogen have no idea how suddenly it acts. We have known a case where to all appearances a man who had had "a mouthful" has been all right, and has protested against any remedial measures being adopted, and yet before he had walked away a dozen yards suddenly collapsed, and fell in a heap, absolutely insensible. Experience alone can enable a manager or other responsible person to judge rightly the necessity of taking prompt precautions in cases of "gassing," and in preventing the repetition of such lamentable accidents as we have had during the past few weeks. We are inclined to think that it would be far more useful if a great many of the rules and regulations which are now so prominently displayed in almost every works that come under the Factory Acts, were supplanted by an explanation of the toxical effects of sulphuretted hydrogen, producer gas, carbon dioxide and nitrous fumes, and a code of regulations for the treatment of all these forms of "gassing." With regard to the rescuing, it seems to us that the negligence which is constantly displayed is decidedly culpable, for there are many appliances (which we are not going to advertise here) that could, and ought to be, always kept ready for use in such cases. It is not as if the case in question was the first, the second, or the third; it is unfortunately one of many, in each of which the same tale is always told. First, one man succumbs unexpectedly to the gas, and then one, two, three, like sheep over a style, away go the would-be rescuers, and, of course, in turn fall victims to the gas. Occasionally the describer of the accident even goes into heroics over the brave volunteers, but in no one single case have we so far been able to find any mention of the hopeless ignorance which leads to such fatuous foolhardiness and futile sacrifice of life. It would be far more to the point if the space devoted to such eulogies were devoted to circulating knowledge about the use of respirators and oxygen in rescuing and restoring the victims.

#### THE LATEST PHOTOGRAPHICAL ADVANCE.

The interesting outcome of Röntgen's amplification of the discoveries made by Professor Crookes in 1879, and Seward in 1890, does not promise to be of great practical value to the chemical trade, but it is sufficiently important from both a scientific and practical point of view to merit brief reference here. As is often the case, the application of the Röntgen's researches was found out by accident.

We shall be sorry if the daily press become too wildly and enthusiastically enamoured of this new process of photography as, though it is full of possibilities, they are in many cases only such as yet. We have not forgotten how aluminium suffered by the uncurbed exuberance of the newspaper correspondent's imagination, and as this new discovery is so full of promise we should like it to have a fair field. We could suggest many pleasingly fanciful ways in which this new discovery might be utilised, but for the nonce we will practice our precept and perpend. We understand that by the applications that have been proved feasible by experiment, surgery is likely to be benefited, while it has been demonstrated that flaws and joints in metals are made visible. This is a great boon, but it does not prove that in future a photogramic record will be made of every yard of railway metal turned out of all the steel works in the country. As we have just said, the possibilities of the process are

great, and varied, and though we shall participate heartily in the rejoicing over each new triumph, we shall be sorry to see the edge of the zest taken off by premature indulgence in exaggerated expectations.

#### THE NATIVE GUANO COMPANY.

The annual report of the directors of this estimable company blossoms forth year by year with all the regularity of a hardy annual, and the comparison holds good in another sense, for it must indeed be a very "hardy" company that can exist for 28 years without ever paying a single penny in the way of dividend. The object of the company is undoubtedly a good one. It is a worthy aim to endeavour to treat sewage, and so solve one of the most difficult problems of the present century, and to do so, moreover, in a way which will render the manurial constituents available for restoration to the land from which they were originally taken. But, unfortunately, the past 28 years show that the results have been distinctly negative as far as the solution of the sewage problem is concerned. The chairman, in his address, speaks well of the prospects of the company, but we cannot help thinking that the silent protest of the last decade speaks even more forcibly. The chairman deals with "ought-to-be's," and aspirations, but the past with facts only. It is certainly very discouraging for the company's "native guano" to find so little favour with "native" agriculturists, and it is a very pretty calculation which the chairman makes when showing that by their process the fertilizing products in the sewage of the Metropolis restored to the soil to grow wheat, to be sold at 27s. per quarter, would realise the sum of £1,350,000. per annum.

On one or two points we cannot help taking exception to the report. To say that the testimony of a man who bears witness to their effluent being bright and clear, but admits he has never analysed it, *proves* that the process is absolutely perfect, is a rather sweeping assertion. The patents of the company are, it seems, gradually expiring, but the chairman says that he does not care very much for the patents, "for we have," he adds, "an experience and knowledge which is locked up in the minds of the officials of our company which we consider worth more than the patents." Very likely so, but, taking one thing with another, we think it is about time it was unlocked, and certainly our sympathies are with the shareholder who admitted it was very pleasing to hear that such good results had been obtained wherever their guano had been used, and granted the chairman's calculations were very interesting, but wished to point out that he had been waiting about a dozen years for a dividend which seemed to him as far off as ever. We quite agree with him, that though it may not be the fault of the process that the guano does not sell well, there must be something wrong somewhere, if out of the 300 towns which have been communicated with, not one could be persuaded to adopt the company's process. The chairman's calculations only apply to London sewage, and are of very little value unless placed side by side with the cost of treating the sewage of, say, Manchester, Salford, Bury, or Bradford, and the quantity of wheat the resulting "guano" would grow. We have not the slightest reason for wishing the process anything but good, but 28 years is a long time and it is as discouraging as it is remarkable that in such long while so promising a process should make so little headway.

SOCIETY OF CHEMICAL INDUSTRY.—*London Section.*—At the next meeting of the Society, which will be held as usual at Burlington House, at 8 p.m., on Monday, February 3rd, Mr. W. F. Reid will present a paper on "The Manufacture of Linoleum."

## The Patent List.

*List is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of T. Davis and Alfred R. Davis, who report professionally value of Chemical Patents.*

### SPECIFICATIONS FOR ENGLISH LETTERS PATENT.

and Purifying Water. J. H. Williams. 821. January 13.  
for Producing Coke with or without Apparatus for Collecting by-products. G. W. Breffitt and F. G. Trebaine. 841. January 13.  
in Obtaining CO<sub>2</sub> from Gaseous Mixtures. W. Raydt. January 13.  
in the Discharge of Salts, etc., from Evaporators. J. 923. January 14.  
of Cyanogen Compounds. A. von Rad and J. Rosenfels. 1,022. January 15.

Grifiers and Grease Catchers. W. Reeves and The Reeves Patent Co., Ltd. 1,041. January 15.  
g Metals by Electricity from weak Solutions and Concentrating electrolyte. J. C. Graham. 1,068. January 15.  
the By-products of Sugar Works. M. Sachs. 1,101. Jan. 16.  
in Electrodes. W. Heraeus. 1,144. January 16.  
in Vessels to contain Acids or other Chemicals. D. M. 1,125. January 17.  
of Gold, Lead, Silver, and Zinc from their Ores. J. Armstrong. January 17.  
aring Silico-Fluoride of Ammonia. W. Mills. 1,275. Jan. 18.

### FACTS OF LATEST COMPLETE SPECIFICATIONS.

*Abstracts are specially prepared for the Chemical Trade Journal RIGHTS of publication are RESERVED. This is the earliest abstracts of Chemical and allied patents accessible to the*

ents in the Production of Chlorine. J. Y. Johnson, 47, Lincoln's elds, London (communicated by the Verein Chemischer Fabrik, tim, Germany). Eng. Pat. 4,267. February 27, 1895.

ent deals with certain improvements in the nitric acid the production of chlorine described in patent 10,604/94. operations described in the latter patent are carried out in ng vessels arranged horizontally instead of vertically only nitric and sulphuric acid mixture to combine with the HCl dded to each vessel, which, in the case of three, means that es are in the proportions 69:23:8. Moreover, the vessels are ch a size that the acid mixture is saturated with HCl after on between the nitric and hydrochloric acids has been . The resulting mixture is run off into a closed vessel, and 130°C to drive off the nitrogen compounds. This end may mplished by adding a solution of HCl and then heating, ase the capacity of the decomposers need not be so great, s no necessity to provide for the saturation of the acid ith gaseous HCl as described above. It appears that the phuric acid produced in this process dissolves something less of chlorine, partly as HCl and partly as nitrosyl chloride. he course of the regeneration of the nitrogen compounds this phuric acid is decomposed, the chlorine dissolved as HCl is into NOCl and Cl<sub>2</sub>.

gases, along with the pre-existing NOCl, pass into the ng vessel, in the upper part of which is excess of water and on as the gases come into contact therewith, the whole of and the Cl<sub>2</sub> are reverted into nitric and hydrochloric acids,

y the whole of the chlorine dissolved by the nitrous vitriol HCl in the nitric acid regenerating vessel, and its presence tal to the satisfactory progress of this step of the process. ne has therefore to be removed before this stage is reached, one by intercepting the nitrous sulphuric acid in a cast iron ted to 130°C, and passing the evolved gases back into the The acid left still contains some chlorine, however. To this, the regenerating vessel is divided into two parts at the e the greatest amount of HCl has been found to collect, and ally de-chlorinated nitrous-sulphuric acid is passed into the g plant, a volume of weak nitric acid, containing an equal chlorine is drawn off at the point just referred to, and sent the process. There are three drawings, two of which ctively the horizontal and vertical arrangement of the plant.

nts in, and in Apparatus for Use in, or in connection with the tion of Sewage and Impure Waters. F. P. Candy, 29, Higher reet, Eccles, Lancs. Eng. Pat. 166. January 2, 1895.

most exhaustive and comprehensive patent, including as hirty-three distinct claims, which are supplemented by

twenty-nine separate drawings. It is impossible to mention even each claim individually, as the wording of the patent is as brief as possible, considering the magnitude and variety of the claims. In summarising the claims we find the first provides for the aggregation of the suspended matters in sewage prior to the removal of the soluble solids by precipitation. The next five claims refer to alternative ways of achieving this. The other main features are the construction of settling tanks for the treatment of the precipitated sewage, and the aeration of the same with oxygen, products of combustion, etc. Aërating filter beds are also described, along with upward flow filters, and various methods of removing and cleansing the fouled lower portions by mechanical means. The six last claims refer to improvements in the construction of the bottoms of settling tanks, and the details of charging and discharging arrangements.

Improvements in Methods and Apparatus for the Continuous Concentration of Liquids. S. M. Lillie, 328, Chestnut-street, Philadelphia, Pa., U.S.A. Eng. Pat. 2,824. February 8, 1895.

The object is to accomplish the constant and automatic concentration of any liquid *in vacuo*, the flow being continuous, but not at a constant rate. The rate of flow is regulated by the degree of concentration desired, which in turn, by means of suitable valves and mechanism, automatically adjusts the supply. In this way a product in a state of fixed and constant concentration is obtained, in conjunction with all the advantages of an automatic and continuous process. There are five drawings, and three different methods of transferring the regulating action of the density of the concentrated solution, to the valve on the supply pipe are described.

Improvements in Cements, Plasters, Paints, and other Analogous Compositions, and in Apparatus for the Manufacture thereof. R. Stone, 23, St. Dunstan's-buildings, London, E.C. Eng. Pat. 25,356. December 31, 1894.

The chief feature is the prevention of splitting or cracking in cement-made paving blocks, etc., or anything containing lime. It is claimed that this end is attained by adding from 1 cwt. to 5 cwt. of loam and silica to the chalk, marble gypsum or other material employed in preparing the cement, etc. The mixture with this addition is much more durable after it has been burnt in a forced draught kiln, ground, mixed and set. By preference, the loam and silica are added to the limestone or chalk rocks, etc., while in a wet or pulpy state. The particular uses for which the finished product is suitable are, as a mortar, and all the customary applications of cement and plaster, being less liable to contraction, as well as fire and water proof; also, for the preparation of limes, for limelight, and as a pigment for white paint. When forming this cement into paving blocks, etc., the material is compressed into moulds by rollers, whereby the blocks acquire a smooth face, are harder, and wear longer. The kiln in which the frit is prepared is circular, and built of fire brick encased in wrought iron cylinders. The fire bars are of special construction, and bear in radial fashion on the side wall of the kiln and a central brick column, raised sufficiently to give the grate bottom a conical tendency.

Improved Method of Recovering Oils or Fatty Substances from Clays, Sands, Ores, Mine Slimes, or other Finely-divided Substances.—S. Crowder, 63, New Broad-street, London. Eng. Pat. 23,228. November 30th, 1894.

The finely-divided substances to be freed from oil, &c., are mixed with excess of water, and introduced into a round V shaped tank, at the bottom of which air is blown in through a distributing rose. The oil is separated, and rises to the top, where it is brushed off by revolving arms or brushes. A simpler method of removal is to allow the oil to collect at the surface, and then introduce enough water into the tank by a side pipe near the bottom, to cause the oil to flow over the edge into a trough running round the top of the tank on the outside. The apparatus as a whole is specially designed to deal with the recovery of oils from finely-divided substances that have been treated according to patent 427/94. There is one drawing.

CARNALITE AS A SUBSTITUTE FOR KAINIT.—Carnalite has frequently been used as a substitute for kainit in fertilizing meadow land, with good results. It seems that grass can stand an amount of chloride that would be harmful to other plants, and consequently carnalite is not prejudicial as a fertilizer of meadow-land, provided a reasonable quantity is used. The difference in the per centages of chloride in carnalite and kainit has been somewhat unduly exaggerated. The latter contains 48 per cent., and the former 60 per cent. In practical agriculture this difference is not found to constitute such a serious drawback as is generally made out.

## PREPARING BARIUM AND CALCIUM FERRO-CYANIDES WITH ORGANIC BASES.

By P. H. WALKER.

THE methods hitherto proposed for the preparation of ferrocyanides of barium and calcium are based either upon the decomposition of Prussian blue by the hydroxides of barium or calcium, or upon double decomposition of barium or calcium salts on the one hand, and potassium ferrocyanide on the other.

It is very difficult to prepare Prussian blue free of potassium, and the double ferrocyanides of barium or calcium with potassium are formed more readily than the simple salts. Even when the simple salts are formed, if any potassium salt has been used in the preparation, it is almost impossible to remove the whole of the potassium by recrystallization.

After trying various other methods for the preparation of barium ferrocyanide, and having very poor success, I undertook, at the suggestion of Dr. Launcelot Andrews, to prepare it according to the following method:—

This method depends upon the formation of the normal strychnine ferrocyanide, the decomposition of this with ammonia, and the decomposition of the ammonium ferrocyanide by means of barium hydroxide. Strychnine was converted into the acetate by gently heating with water and the calculated amount of acetic acid. This salt, though one of the most soluble salts of strychnine, readily separates in the crystalline form from comparatively dilute solutions when allowed to cool, so it is best to keep it warm. A solution of the calculated amount of potassium ferrocyanide was added to the strychnine acetate, allowed to stand in a warm place, stirred frequently, and the white crystalline strychnine ferrocyanide filtered and washed. After washing, the strychnine ferrocyanide was thoroughly mixed with ammonia water in excess, which decomposed it, forming ammonium ferrocyanide and precipitating strychnine, which was easily separated from the solution of ammonium ferrocyanide, and could be used over again.

The solution of ammonium ferrocyanide, with excess of ammonia, was then boiled with a solution of the calculated amount of barium hydroxide until no more ammonia was given off. The solution was allowed to cool, decanted from the crystals, and the mother liquid further evaporated. The crystals were dried in the air. They were found to contain a very slight amount of barium carbonate. On analysis, they gave 9.43 per cent. of iron and 46.98 per cent. of barium, which corresponds very closely to a salt of the composition represented by the formula  $\text{Ba}_2\text{Fe}(\text{CN})_6 \cdot 6\text{H}_2\text{O}$ , and which is described in Wurtz Dict. de Chim., p. 1090.

The barium ferrocyanide can be easily prepared by this method. The main objections to this method are the bulk of liquid required to dissolve the strychnine salt, and the chance of the formation of barium carbonate during the boiling of the ammonium ferrocyanide solution with barium hydroxide. This last objection can be largely avoided by boiling in a large flask, not with the direct flame, but by passing in a current of live steam. This latter method also has the advantage of inducing the formation of better crystals of barium ferrocyanide.

The following equations represent the reactions:—

- (1)  $\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2 + \text{CH}_3\text{COOH} = \text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2\text{CH}_3\text{COOH}$ .
- (2)  $4\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2\text{CH}_3\text{COOH} + \text{K}_4\text{Fe}(\text{CN})_6 = (\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2)_4\text{H}_4\text{Fe}(\text{CN})_6 + 4\text{CH}_3\text{COOK}$ .
- (3)  $(\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2)_4\text{H}_4\text{Fe}(\text{CN})_6 + 4\text{NH}_3 = 4\text{C}_{21}\text{H}_{22}\text{N}_2\text{O}_2 + (\text{NH}_4)_4\text{Fe}(\text{CN})_6$ .
- (4)  $(\text{NH}_4)_4\text{Fe}(\text{CN})_6 + 2\text{Ba}(\text{OH})_2 = 4\text{NH}_3 + 4\text{H}_2\text{O} + \text{Ba}_2\text{Fe}(\text{CN})_6$ .

Quinoline ferrocyanide was prepared in a similar manner, and this was treated directly with barium hydroxide solution, and the attempt made to get rid of the quinoline by distilling. A large amount of Prussian blue was formed, however, and the mass was thrown away. No other attempt was made using quinoline, as it was then thought that dimethylaniline would answer.

This latter method is the easiest tried, and leaves little to be desired. Dimethylaniline is mixed with water, and hydrochloric acid added in slight excess. This solution then mixed with potassium ferrocyanide solution, the whole filtered and the precipitate washed with the least possible amount of water, then with alcohol, and finally with ether, and dried between pieces of filter-paper. As little water as possible must be used, as the salt is rather soluble.

### ANALYSIS OF THE DIMETHYLANILINE SALT.

Into a beaker was put 0.2220 gram with about one gram pure calcium carbonate, titrated with standard silver nitrate (one c.c. = 5.829 milligrams sodium chloride) using potassium chromate as indicator. Required 18.4 c.c. The end reaction was not very sharp, and after standing over night the red colour disappeared. Then added more of the silver solution, making a total of 19.5 c.c. One c.c. of the above silver nitrate solution would be equivalent to 11.26 milligrams diacid dimethylaniline ferrocyanide. Therefore the 19.5 c.c. would correspond to 0.21957 gram.

Taken, 0.1325 gram mixed with water and two c.c. dilute sulphuric acid added. Then added 17.18 c.c. silver nitrate solution and two c.c. solution of iron alum, titrated back with solution of potassium thiocyanate corresponding to the silver nitrate solution. Required six and one-tenth c.c. Therefore 11.08 c.c. silver nitrate solution used up by salt. In this the end reaction was not sharp.

Taken, 0.1341 gram salt. Treated as above except filtered before titrating back silver nitrate. Sixteen c.c. silver nitrate added, four and one-tenth c.c. potassium thiocyanate required. Therefore 11.9 c.c. silver nitrate solution used, which corresponds to 0.1340 gram of the diacid salt.

Mixed 0.1350 gram with water and titrated with tenth normal sodium hydroxide, using phenolphthalein as indicator.

Required twelve c.c. which corresponds to 1.1351 gram of the diacid salt.

The compound is, therefore, the diacid dimethylaniline ferrocyanide  $[\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2\text{H}_2\text{Fe}(\text{CN})_6]$ , a white crystalline salt, which is somewhat soluble in water.

### PREPARATION OF BARIUM FERROCYANIDE BY THE DIMETHYLANILINE FERROCYANIDE METHOD.

30.5 grams diacid dimethylaniline ferrocyanide is mixed with barium hydroxide solution containing 22.5 grams barium hydroxide and shaken violently for some time in a flask or separatory funnel. Most of the barium ferrocyanide crystallizes out directly, and can be filtered from the liquid. The dimethylaniline is recovered by shaking the liquid with ether, which also causes more of the barium ferrocyanide to separate.

The crystals of barium ferrocyanide should be well washed, first with a little water and then with alcohol. The following equations express the reactions taking place:

- (1)  $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2\text{H}_2 + \text{HCl} = \text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2\text{HCl}$ .
- (2)  $2\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2\text{HCl} + \text{K}_4\text{Fe}(\text{CN})_6 + 2\text{HCl} = 4\text{KCl} + [\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2\text{H}_2]_2\text{Fe}(\text{CN})_6$ .
- (3)  $[\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2\text{H}_2]_2\text{Fe}(\text{CN})_6 + 2\text{Ba}(\text{OH})_2 = 2\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2 + 4\text{H}_2\text{O} + \text{Ba}_2\text{Fe}(\text{CN})_6$ .

Barium ferrocyanide  $[\text{Ba}_2\text{Fe}(\text{CN})_6 \cdot 6\text{H}_2\text{O}]$  crystallizes in oblique rectangular prisms belonging to the monoclinic system. The crystals are unaltered in the air at ordinary temperature, lose eleven-twelfths of their water at 40°C., the rest of the water is not driven off until the salt begins to decompose. The solubility varies from one in 584 parts cold water to one in 116 parts boiling water. Dammer gives the solubility as varying from one in 1,000 parts water at 15° to one in 100 at 75°.

### SOLUBILITY OF BARIUM FERROCYANIDE.

Some solubility determinations were made on the salt prepared as above. The apparatus used was, I believe, devised by Dr. Launcelot Andrews. The apparatus consists of two Woulff bottles, A and B. A has three necks. The middle neck contains a perforated stopper holding a thermometer, the bulb of which goes nearly to the bottom of the bottle. The left hand neck has a stopper carrying a short glass tube which can be connected with the suction pump. The right hand neck has a stopper with a tube passing through, and reaching to the bottom of the bottle; in fact, it is better to have the tube touching the bottom. This tube is connected to a tube passing through one of the necks of B, the other neck of B has a tube passing nearly to the bottom of the bottle. Water is put in the two Woulff bottles, and in A a larger amount of the salt to be tested than can be dissolved by the water. The whole apparatus is then put in a vessel of water, and air drawn through for several hours. The water in B preventing any evaporation from A. The current of air is then stopped long enough to allow the undissolved portion to settle. A measured amount of the clear liquid taken out, noting the temperature, evaporated and residue weighed.

|      | Amount solution. | Temperature. | Residue. Grams. | Parts water. |
|------|------------------|--------------|-----------------|--------------|
| I.   | 5 c.c.           | 18°C.        | 0.0194          | 257.7        |
| II.  | 5 c.c.           | 18°C.        | 0.0198          | 252.5        |
| III. | 30 c.c.          | 18°C.        | 0.1190          | 252.1        |
| IV.  | 25 c.c.          | 17°C.        | 0.0936          | 267.0        |
| V.   | 25 c.c.          | 19°C.        | 0.0930          | 268.8        |
| VI.  | 25 c.c.          | 16°C.        | 0.0924          | 270.5        |

These results fall within the limits as given by Wurtz.

### PREPARATION OF CALCIUM FERROCYANIDE.

Twenty-three grams of diacid dimethylaniline ferrocyanide mixed with water and milk of lime prepared from six grams pure lime. The mixture shaken violently in a flask, allowed to stand some time, filtered, shaken with ether to separate the dimethylaniline, separated from ethereal solution with separatory funnel, evaporated down in flask, carbon dioxide passed through, again boiled, filtered, and evaporated to about 50 c.c. Alcohol then added, which causes crystals to separate. Then crystals dried between filter paper. The crystals

are of a pale yellow colour, and are very soluble in water. When a saturated solution is allowed to stand for a long time at the temperature of the laboratory, large flat crystals are deposited.

#### NOTE ON THE SEPARATION OF IRON AND ALUMINUM.

Since strychnine ferrocyanide is almost insoluble, and is easily filtered, it may possibly be used to separate iron and aluminum in the following manner.—

The solution containing ferric and aluminum salts is treated with excess of strychnine ferro-cyanide. The Prussian blue thus formed can be filtered with ordinary filter-paper, and the aluminum precipitated by ammonia from the filtrate. By this method I have easily gotten perfectly white aluminum oxide; but have not as yet gotten the conditions for a complete quantitative separation.

I wish in conclusion to express my thanks to Dr. Launcelot Andrews, who, by his advice and assistance, rendered this work possible.

### CITY AND GUILDS OF LONDON INSTITUTE.

THE annual distribution of prizes and certificates to students of the colleges and schools connected with the City and Guilds of London Institute for the advancement of technical education took place last week at Merchant Taylors' Hall, Threadneedle-st., E.C. In addition to the Lord Mayor, who occupied the chair, there were present Sir Edward Clarke, Q.C., M.P., Alderman Sir Stuart Knill, Sir Frederick Abel, Alderman Vaughan Morgan, Sir Owen Roberts, Sir Philip Magnus, Sir Walter Prideaux, Professor Silvanus Thompson, Professor W. C. Unwin, Prebendary Whittington, Dr. Garnett, Mr. Beckwith (treasurer), the Master of the Merchant Taylors' Company, the Master of the Salters' Company, Mr. E. Nash, Mr. Rokeby Price, and Mr. Bousfield. The report, which was read by the hon. secretary (Mr. John Watney), stated that the object with which the institute was founded nearly 20 years ago was to benefit the productive industries of this country by promoting and encouraging the application of science and art to industrial purposes. Two-thirds of the funds required for carrying on the work was contributed by the Corporation and the principal Livery companies of the City. Sir Edward Clarke distributed the numerous prizes, and expressed the opinion that a great deal of money was being annually wasted in this country on technical education. The City companies had fortunately not made the mistake of attempting to deal with manual dexterity. But the more the introduction of machinery and of science tended to reduce the work of the ordinary labourer to a mere mechanical performance, the greater necessity there was that there should be the highest skill in the direction of that labour. It was satisfactory, therefore, to find that that was the work which the institute had set itself to accomplish. Sir Frederick Abel and Mr. Beckwith having addressed the meeting, the proceedings terminated with a vote of thanks to Sir E. Clarke and the Lord Mayor.

### ELECTROLYTIC ESTIMATION OF MERCURY IN CINNABAR.

IN a paper recently read before the American Chemical Society, Messrs. W. B. Rising and V. Lenher describe a method of determining mercury in cinnabar by electrolysis. When rapid solution of cinnabar is desired, heretofore, oxidation with aqua regia has seemed most convenient; the length of time required to expel the nitric acid used, and the likelihood of loss of mercury by distillation in hydrochloric acid, are serious hindrances to the use of this method. Hydrobromic acid dissolves very readily mercuric sulphide, as well as many other naturally occurring sulphides with the evolution of hydrogen sulphide and the formation of the bromide.

If this solution be nearly neutralized with caustic potash, pure potassium cyanide added in sufficient excess to dissolve the cyanide first precipitated (Smith, Electro-Chemical Analysis, p. 58, and C.T.J., Nos. 171 and 203), and electrolyzed with a weak current, the mercury will be readily deposited as metal on a platinum dish used as a negative electrode. The use of hydrobromic acid is to be recommended, as it gives such a ready method of decomposition, and can be used at low temperatures, when there will be no loss of mercury by distillation.

The hydrobromic acid used in the following experiments was prepared by treating potassium bromide with sulphuric acid of 56° Baumé; the gas was conducted into water, as in the preparation of hydrochloric acid. By using potassium bromide with the above strength of acid, hydrobromic acid quite free from bromine, can be readily prepared.

The ordinary hydrobromic acid used in the laboratory, containing bromine, could be used in the following experiments:

The first sample which was worked with was pure mercuric sulphide. Hydrobromic acid of constant boiling point, i.e., forty-nine per cent. was diluted with water one to four, and the sample treated with as little excess as possible over what would be necessary for its solution;

the slight excess of acid was neutralised with potassium hydroxide potassium cyanide added in excess and the solution electrolyzed by a current giving 0.025 ampere N.D. 100.

The following results were obtained:

| Mercuric sulphide.<br>gram. | Mercury found.<br>gram. | Mercury.<br>Per cent. |
|-----------------------------|-------------------------|-----------------------|
| 0.2110                      | 0.1818                  | 86.16                 |
| 0.2058                      | 0.1774                  | 86.20                 |

The second sample was a naturally occurring cinnabar; determination (a) was made, using the decomposition by aqua regia, evaporating off the excess of nitric acid with hydrochloric, neutralizing the excess of hydrochloric acid with potassium hydroxide, adding potassium cyanide in excess and electrolyzing as before. (b) and (c) were treated with 20 per cent. hydrobromic acid at the boiling temperature; solution was effected in a few minutes, the excess of acid was neutralized by potassium hydroxide, potassium cyanide added in excess and electrolyzed with the same strength of current as before.

Results were:

|          | Cinnabar.<br>gram. | Mercury found.<br>gram. | Mercury.<br>per cent. |
|----------|--------------------|-------------------------|-----------------------|
| (a)..... | 0.2024             | 0.1046                  | 51.68                 |
| (b)..... | 0.2514             | 0.1299                  | 51.67                 |
| (c)..... | 0.5135             | 0.2656                  | 51.72                 |

The last sample was a lower grade cinnabar, very silicious, and long digestion with either hydrobromic acid or aqua regia was necessary. In this last experiment the action of the hydrobromic acid was very much more rapid than that with aqua regia. The mercury was deposited from a cyanide solution as before.

Results were, using hydrobromic acid as solvent:

|          | Cinnabar.<br>gram. | Mercury found.<br>gram. |
|----------|--------------------|-------------------------|
| (a)..... | 0.2011             | 0.0616                  |
| (b)..... | 0.2011             | 0.0622                  |

Using aqua regia as solvent:

|          | gram.  | gram.  |
|----------|--------|--------|
| (a)..... | 0.2030 | 0.0629 |
| (b)..... | 0.2030 | 0.0631 |

### EXPORTS OF PETROLEUM FROM U.S.A.

THE Chief of the Bureau of Statistics, Washington, gives the following returns of the exports of petroleum and petroleum products for November, 1895. The total shipments were 75,150,487 gallons, compared with 76,955,316 gallons in 1894. The total for the eleven months ending November, 1895, was 772,540,884 gallons, against 811,801,939 gallons during the same period in 1894. The details of the shipments are as follow:—

| CRUDE PETROLEUM.            |  | Gallons.   |
|-----------------------------|--|------------|
| Total, November, 1895 ..... |  | 10,706,080 |
| " " 1894 .....              |  | 11,925,791 |
| NAPHTHAS.                   |  |            |
| Total, November, 1895 ..... |  | 1,533,344  |
| " " 1894 .....              |  | 2,231,689  |
| ILLUMINATING.               |  |            |
| Total, November, 1895 ..... |  | 58,548,852 |

**FIRE AT AN OIL GAS WORKS.**—A serious fire broke out last week at the oil gas works of the London, Brighton, and South Coast Railway, Cold Blow-lane, New-cross. It originated in a railway arch, used as a store, which contained some 4,000 gallons of oil, and spread so rapidly that the firemen, with six steamers, were unable to prevent very serious damage. The Chief Officer of the Fire Brigade in his official report thus records the damage:—"Two railway arches, each about 30 ft. by 25 ft., one containing about 4,000 gallons of oil, the other about 5,000 gallons of tar, a gasometer, about 12 ft. in diameter, burnt out, and a quantity of stock in yard severely damaged by fire, three arches, each of two floors, about 30 ft. by 25 ft. (used as stores), and a building of one floor, about 90 ft. by 30 ft. (used as manufactory), and the contents damaged by fire and water, and about 70 ft. of wooden fencing damaged by fire and cutting away (all adjoining and communicating). William Hopkins, aged 27 years, burned on the hands, arms, and face, and taken to a hospital."

## THE CHEMICAL SOCIETY.

A SPECIAL meeting of the Chemical Society was held at Burlington House last week, when Professor G. F. Fitzgerald, F.R.S., of Trinity College, Dublin, delivered a memorial lecture on the life and work of the late Professor Von Helmholtz. There was a large audience, including Sir Joseph Lister, Lord Rayleigh, Sir Henry Roscoe, Professor Armstrong, Dr. Frankland, Professor Ramsay, Professor Roberts-Austen, and others. The lecture dealt mainly with very abstruse questions of the physical constitution of matter, viewed in relation to theories enunciated by Helmholtz. The lecturer mentioned that the children of his intellect valued most by Helmholtz himself were not the ophthalmoscope, nor his physiological theories of sight and hearing, nor his chemical and electrical theories, but his mathematical theories of fluid and vortex motion (*vide C.T.J.* 400, p. 43). Remarking that to the Chemical Society the bearing of Helmholtz's work in this direction on chemical action would be most interesting, Professor Fitzgerald proceeded to show some of the difficulties inherent in Lord Kelvin's suggestion, based on Helmholtz's theories, that atoms are vortices in a perfect fluid, and went on to consider some of the applications of thermodynamics to chemical theory as worked out by Helmholtz. Passing to the discussion of some of the problems of capillarity, solution, and electrolysis, he concluded by saying that Helmholtz, by his physiological, chemical, and physical researches, had brought us measurably nearer to an ultimate dynamical explanation of the universe.—In proposing a vote of thanks Sir Joseph Lister, President of the Royal Society, said he recollected with pride that Helmholtz was a medical practitioner. That from being such he should have become a brilliant physicist was a very remarkable fact. He would have done enough to claim the gratitude of physicians and surgeons if he had done nothing else than explain the accommodative power of the eye to varying distances and invent the ophthalmoscope.—Dr. Frankland seconded the resolution, and among the subsequent speakers were Lord Rayleigh, Sir Henry Roscoe, Professor Armstrong, and Professor Poynting.—In adjourning the meeting the President (Mr. A. G. Vernon Harcourt) mentioned that Helmholtz was half an Englishman, seeing that his mother was a Miss Penn, who was connected with the family of the founder of Pennsylvania.

## AMERICAN PRODUCTION OF MANGANESE IN 1894.

ACCORDING to the latest report of the United States geological survey, which has been compiled by Mr. Jos. D. Weeks, the production of manganese ores proper in the United States in 1894 shows a reduction from the previous year, the product being 6,308 tons in 1894, as compared with 7,718 tons in 1893. The production of 1894 is the smallest of any year since 1884. The production of Arkansas in 1894 was about the same as in 1893; California shows a reduction of 122 tons, Virginia a reduction of about 2,300 tons, while Georgia shows an increase of 553 tons, Tennessee an increase of 440 tons, and West Virginia, which does not appear at all in previous years, shows a production of 100 tons.

The total value of the 6,308 tons produced in 1894 was £10,727, or about 35s. 6d. a ton, as compared with a total value in 1893 of £13,332, and an average value of about 36s.

The amount and value of the manganese ore produced in the United States in 1893 and 1894 is shown in the following table:—

Amount and Value of Manganese Ores Produced in the United States in 1893 and 1894.

| States.           | 1893.                  |                 |                   | 1894.                  |                 |                   |
|-------------------|------------------------|-----------------|-------------------|------------------------|-----------------|-------------------|
|                   | Product.<br>Long tons. | Total<br>value. | Value<br>per ton. | Product.<br>Long tons. | Total<br>value. | Value<br>per ton. |
| Arkansas .....    | 2,020                  | \$24,240        | \$12 00           | 1,934                  | \$19,564        | \$10 13           |
| California .....  | 400                    | 2,000           | 5 00              | 278                    | 1,800           | 6 47              |
| Georgia .....     | 724                    | 5,068           | 7 00              | 1,277                  | 8,620           | 6 74              |
| Tennessee .....   | 482                    | 4,504           | 9 34              | 922                    | 6,993           | 6 50              |
| Virginia .....    | 4,092                  | 30,802          | 7 53              | 1,797                  | 16,658          | 9 27              |
| W. Virginia ..... | —                      | —               | —                 | 100                    | 1,000           | 10 00             |
| Total....         | 7,718                  | 66,614          | a8.63             | 6,308                  | 53,635          | a8.50             |

a Average.

A comparison of this table with that of previous years shows the uncertainty accompanying the production of manganese ores. To go back only to 1891: In this year eight States were producers of manganese, the total production being 23,416 tons. In 1892 but three States produced, but still the total was 13,613 tons. In 1893 five States produced manganese, but the total production fell to 7,718 tons; and though in 1894 six States produced manganese, the total production had fallen off, as compared with 1893, 1,410 tons, and as compared with 1891, 17,108 tons.

A comparison of the production of the different States in 1891 with 1894 will show this change even in a more marked degree. In 1891 Virginia produced 16,248 tons; in 1894 only about one-ninth of that amount; that is, 1,797 tons. In 1891 Georgia produced 3,575 tons; in 1894 but 1,277 tons, a little more than one-third. In 1892 Arkansas produced 6,708 tons; in 1894 but 1,934 tons, less than one-third.

The decrease in production of manganese occurs chiefly from the apparent exhaustion of the Crimora deposit in Virginia and to the exhaustion of the pockets that have been worked in Georgia and Arkansas. The depression in the steel industry and the low prices at which manganese ruled for a while discouraged further search and development. It is by no means certain or even probable that the manganese deposits in Virginia, Cattersville, and Batesville districts are exhausted. New pockets will undoubtedly be found in all three districts, but we may always look for great fluctuation in the production of manganese in the different States.

There will also be a fluctuation in the value of the ores mined, due not only to changes in price growing out of supply and demand, but also out of the increased or decreased richness of the ore. As a rule the ore mined at the beginning and close of working a pocket is somewhat leaner than that produced when the pocket is yielding large returns of ore; that is, around the edges of the pocket the ore is apt to be leaner than in the centre.

## PETROLEUM REFINING IN HUNGARY.

THE mineral oil refinery at Oravicza, South Hungary, has been handling none but Caucasian oil since 1886. In the first of the two principal buildings, consisting of central hall and two side halls running parallel to each other, 18 distilling vats are placed in groups of four and six. Their capacity, including the condensing apparatus, is two tons each. The fireplaces are in the central hall, while the coolers are located in the side halls, which are separated from the former by partition walls. The products of distillation are led in conduit pipes from the condensers to a side room of the second main building. Here are the departments for refining, filtering of heavy mineral oils, and for the manufacture of lubricating oil and axle grease. An engine of 16 horse-power, two air compressors and four pumps are fitted up in two side rooms. In another building the distilled product is refined; it contains 15 tanks of a capacity of 3.3 tons each. In the refining department of the second main building there are four mixing apparatus of 4.5 tons and 20 smaller ones of 1.5 to 2 tons capacity each. These serve for the treatment of the oils with sulphuric acid, lye, and water. Besides, there are separate tanks and pumps, and departments for filtering the heavy mineral oils and production of the different lubricating oils. The 11 pumps in the refining department are connected with an extensive system of pipes and effect the movement of the crude, half-finished and finished material.

By distillation the crude oil is separated according to its specific gravity, into petroleum 0.820—0.825 specific gravity, burning oil of 0.885 specific gravity, and mineral grease of 0.900—0.906 specific gravity.

The refining of the distilled product is accomplished by treating it with sulphuric acid of 66° B., then with a solution of soda, and, finally, by washing it with water. The factory handles annually 3,500 to 4,000 tons crude oil and produces therefrom 2,800 to 3,200 tons of petroleum of 0.825 specific gravity and 500 to 600 tons of heavy mineral oils of from 0.885 to 0.906 specific gravity. Of by-products there are produced annually: 120 tons of machine oil, 100 tons of solid greases, and 600 tons of other different products. The works require annually: 1,000 tons of coal, 130 tons of sulphuric acid, 8 tons soda-ash and 8 tons quicklime.

CHANGE OF ADDRESS.—We are informed by the Southgate Engineering Co., Ltd., that this company has removed its London office from 170, Fenchurch-street to Leadenhall House, Leadenhall-street, E.C. This office will be under the management of Mr. J. Reid.

A DECAYING BRITISH INDUSTRY.—The competition which is at the present time so actively felt in the iron ore trade in consequence of the very large importation of Spanish and other foreign ores into this country is having a serious effect on the native hematite iron ore trade of the north-west of England. Lately, even in this district, Spanish ores have been largely imported to compete with the native products, and some of the firms in Furness and Cumberland are now using 20 to 25 per cent. of foreign ore, although native hematite mines surround their blast furnaces. Spanish ores are quoted at 12s. per ton delivered at West coast ports, and the quality of the metal is higher than that of home produce. It is felt that the only means by which raisers of iron ore in this country can successfully compete against foreign ore will be reduced railway charges and reduced royalties.

### THE RAPID ESTIMATION OF INSOLUBLE PHOSPHATES.

(To the Editor of the Chemical Trade Journal.)

SIR,—As one having made a speciality of manure analyses, I am somewhat surprised to read Mr. Vincent Edwards' suggestion as to the use of the Volumetric Uranium method in rapid tests for "insoluble phosphates."

I have used the method in past years in many hundreds of analyses of manures, and from lengthened observation found the conditions requisite for securing the most accurate results to be the very reverse of those now described by Mr. Edwards, viz., "That a diluted titration led more frequently to too high figures being obtained, the Uranium precipitate not being of constant composition."

I cannot agree with Mr. Edwards' assumption of iron and alumina phosphates being included in his results, that is to say, without previous precipitation by magnesia, after Joulie, and as a rapid and accurate estimation by weight can now be effected in a reasonable time I see no advantage in Mr. Edwards' views on the question of rapidity; on the contrary, if too high figures should be given by the uranium method under the conditions he describes, manufacturers would be placed at a disadvantage, their figures becoming contradicted in the buyer's hands. To have perfect phosphate determinations is of the utmost importance to makers of manure, as many cases of dissatisfaction arise from faulty tests, too high figures being given (frequently so) as regards soluble phosphate.—Yours, &c.,

ALFRED FIRBY.

Analytical Laboratory, 10, Infirmary-street, Leeds.

### THE PRICES OF CRUDE NAPHTHA AND BENZOL.

(To the Editor of The Chemical Trade Journal.)

SIR,—I should like to again draw attention to the extraordinary fact of the illogical discrepancy between the present prices of 30% crude naphtha and 90's benzol.

A short time ago 30% crude naphtha was quoted at about 5d. and 90's benzol at 11d., thus giving a margin of, say, 6d., including cost of manufacture and distiller's profit.

At present with 90's benzol at, say, 2s. 4d., and crude naphtha at, say, 10d., the margin is 1s. 6d., i.e., three times as large as before for almost exactly the same work.

Assuming, for argument's sake, that this previous margin of 6d. was half for cost of manufacture and half for profit, the position of things would be that, the cost of manufacturing remaining approximately the same, the profit is increased as 3d. is to 1s. 3d., i.e., the present profit of the benzol distiller is about five times as large as before the rise.

The matter is so totally inexplicable to me that one would think the present high prices of benzol must be due to some artificial handling, for if there were any prospect of this or similar prices being maintained, or of a further rise, surely makers of 90's benzol would long ago have been glad and ready to pay a higher price than 10d. for crude naphtha.—Yours truly,

HENRY SIMON.

Manchester, January 30, 1896.

### ANSWERS TO CORRESPONDENTS.

TEMPUS.—It will not be before Whitsuntide. We have not lost sight of the matter, and shall be well prepared as soon as the time for action arrives.

SUBSCRIBER.—The best we can do with regard to your query about coal-tar naphtha is to refer you to Lunge's work on the subject, which will tell you all there is to be told.

H. K. P.—It is too high. We have had several far better offers.

N. C.—It will be a regular feature. We thank you for your complimentary criticism.

M. D. AND J. W.—We are glad you were pleased.

## Trade Notes.

CHEMICALS *via* THE SHIP CANAL.—During the past week the following cargoes of interest to the chemical trade have been imported:—Seventeen cargoes of stone and slate, thirteen of pottery material, eight of pig iron, one of resin, and one of logwood. There were also shipments of bauxite and Esparto grass from Marseilles and Almeria respectively. The exports included two cargoes of purple ore, one of pitch, and one of salt. Among the steamers fixed for Manchester there is the *Cato*, 701 tons, and *Napoli*, 852 tons, with wood pulp, from Drontheim and Christiania; *Newcastle*, 833 tons, *Dunstaffnage*, 874 tons, and *W. Harkess*, 736 tons, with timber and pulp, from Gothenburg, &c., and *Hollinside*, 692 tons, and *Cymbeline*, 880 tons, with timber, pulp, &c., from Hango.

COMBINATION OF THE FRENCH SLAG PRODUCERS.—We learn that a combination of the French producers of Basic slag has been all but concluded. The main objects of the combine will be the maintenance of prices at a remunerative level, the protection of the trade against foreign competition and the repression of the fraudulent adulterations, which it appears are being practised on an extensive scale. The combine will adopt a special trade mark, and will have central offices and sale rooms in Paris.

INSTITUTE OF CHEMISTRY EXAMINATIONS.—At the examination for admission to the membership of the institute, held from January 7th to 10th, the following candidates were successful:—G. H. Appleyard, Yorkshire College, Leeds; J. H. Coste, Finsbury Technical College; G. George, Merchant Venturers' Technical College, Bristol; F. Hudson-Cox, School of the Pharmaceutical Society, and University College, London; P. C. H. Hunt, Mason College, Birmingham; and E. J. Parry, B.Sc. (London), Guy's Hospital. Of the candidates for the intermediate examination, the following satisfied the examiners:—P. G. Jackson, University College, Nottingham; E. J. Reade, B.A. (Cantab); and H. S. Shrewsbury, University College, Nottingham. The examiners were Professor W. R. Dunstan and Mr. Otto Hehner. The members of the institute now number over 900, and there are over 200 registered students.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are a shade easier, with 50/90's at 1s. 10½d. and 90's at 2s. 2d. Carbolic acids are very firm at advanced prices, 60% crude now being quoted at 1s. 10½d. to 1s. 11d. and 40% crystals 7d. Crude naphtha and solvent remain as last quoted, and creosote and anthracene are also unaltered. Pitch quiet at 36s., f.o.b., East Coast.

Sulphate of ammonia is firmer, and prices rather better in comparison with the exceptionally low values that have been current during the past week. Beekton quotation is now £8. 10s., and the same price stands good for the other ports. Forward is quiet, buyers being scarce, and shy owing to the firmer tone of the last day or two.

### LIVERPOOL MINERAL MARKET.

There has been very little change in our market this week, and the good tendency continues. Manganese: The arrivals have been very small; what little has arrived has been against forward purchases, and goes straight into consumption, whilst stocks are further reduced; prices are, therefore, very firm. The higher percentages for chemical works are very scarce. Ground manganese: Prices continue very strong at £6., £8., £10., and £12. 10s. per ton, according to quality. Manganiferous iron ore continues without alteration at 16s. to 17s. 6d. per ton, c.i.f. Chrome ore: The arrivals have been only very small this week; the demand keeps good at 70s. to 100s. and 105s. per ton, according to quality. Bauxite: Sales have been at good figures, and prices remain firm at 20s. per ton for first, 16s. per ton for second, and 12s. per ton for third quality, f.o.b., in cargoes. French chalk: The arrivals have continued but slow, and the consumption is larger than the supply; in consequence the prices are very strong for "Angel White" brands at 70s. to 75s., 80s. to 90s., and 100s. to 110s. per ton, according to grade. Wolfram and scheelite: There has been a continued demand for these ores, and as the spot stock of high qualities is exceptionally small, prices are very strong. Arsenic continues very scarce at £17. to £19. per ton. Fuller's earth: The demand continues fair, and the prices for "Emerald" and other brands continue steady at 50s. for lump, 55s. to 75s. for powdered. Rottenstone: Prime quality is scarce, and brings good prices; sales are being made at £8. 10s. to £15. per ton, according to grade. The market for ochres and umbers remains steady; there is a steady demand for J.C. ochre, which is being done at 60s. to 65s. per ton, and prime umber is in fair demand at 40s. to 45s. per ton. Carbonate and sulphate of barytes continue practically without alteration; the demand is rather quiet, but prices are firm. Feldspars and fluorspars are unchanged, a fair business being done. Emery stone is in rather better request at full prices. Plumbago: The demand for foundry and lubricating purposes is very good, at £6. to £10. per ton. Ceylon qualities are in good demand at £15. to £20. per ton. Pumice stone: The finer grades of lump and powdered are in good demand, and bring good prices. Iron ore is quiet, and without change, at about 10s. per ton. Bog ore is in better demand; good quality bringing 25s. to 25s. per ton, according to quantity. Lead ore: With the better prices ruling for this article the price for potters' qualities has advanced accordingly, and is now firm at £12. to £14. per ton for good selected quality.

## REPORT ON MANURE MATERIAL.

The market for phosphates continues to drag, but for nitrogenous material the tone has somewhat improved in sympathy with nitrate of soda. It is early to form any reliable opinion as to the coming manure season, but so far as can at present be seen, the prospects appear encouraging. A spell of severe weather might, however, seriously alter the outlook, and it is not too late for such a contingency. Meantime, although manure makers are pretty well satisfied that present level of prices is favourable for further purchasing, they seem disposed to wait events some time longer. Quotations for mineral phosphates are unchanged, and in the absence of important business, quotations must be taken as nearest market values. There has been more doing in River Plate bones, but prices accepted do not transpire. Nearest value is probably £3. 15s. per ton, though for handy cargoes something more might have to be paid. Crushed Kurrahee bones on spot may be had at £3. 18s. 9d. per ton, but for shipment £4. is required. Bombay bone meal continues to offer freely for shipment, at £3. 15s. to £3. 16s. 3d. per ton, according to position, for ordinary quality, and on spot at £3. 16s. 3d. to £4. per ton, according to quality. Common grinding bones are worth £3. 10s. to £3. 15s. per ton, according to quality and condition. Owing to the reported agreement of producers of nitrate of soda to reduce output, the market is firmer in all positions, but the large visible supply for the coming season prevents any very substantial advance. On spot, the quotation is 7s. 9d. to 7s. 10½d. per cwt., according to quality. Due cargoes at the close are worth about 7s. 9d. per cwt., ordinary quality. Home prepared dried blood, fine quality, may still be had at 7s. 6d. per unit of ammonia, though sellers seem disposed to hold for more money.

## MISCELLANEOUS CHEMICAL MARKET.

Business in the alkali trade is fairly active, both for export and home account. The price of alkalis all round is steadily maintained. There are no changes in quotations either for caustic soda, ammonia alkali, or Leblanc soda ash. Caustic soda quotations on the spot are as follows:—F.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 10s.; 70%, £7. 10s.; 60%, £6. 10s. nett per ton, 10-ton lots and upwards. Soda crystals unchanged at 35s., bags, makers' works. Bleaching powder is in steady and good demand at £7., makers' works, and £6. 15s. to £7. 5s. per ton, hardwoods, f.o.b., according to market. Saltcake firm and in strong request at 25s. to 27s. 6d., f.o.r. Sulphur £3. 12s. 6d. per ton. Chlorate of potash 3¼d. per lb.; soda 6½d., but there are some small resales at fractions below these quotations. For white powdered arsenic price has further advanced, owing to the continued scarcity—£17. to £17. 10s. being paid for odd lots. Sulphate of copper firmer at £15. 15s., f.o.b. Tartaric acid advanced to 1s. 2½d. per lb. Acetate of lime, brown, still overstocked, and price depressed accordingly—quotations, £4. 15s. to £5., c.i.f.; grey acetate of lime £7. 15s. nett, c.i.f.; brown sugar of lead scarce at £15. 10s., c.i.f. White sugar of lead flat and without change in price. Acetic acid selling freely, and price steady. Acetate of soda in fair request at £14. to £14. 5s., c.i.f. Potash, caustic and carbonate, meet with good inquiry, and prices are firm. Yellow prussiate of potash 7¼d. to 8d. Sulphocyanides quiet, and prices unchanged. Cyanide of potassium is a turn easier at 1s. 3d. per lb. Muriate of ammonia is in fair request, and price firm at £23. per ton. Other ammonia salts steady. Carbolic acid crystals have improved in value, and there is a strong demand. Reports generally do not indicate any marked improvement in the general trade.

## THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, firm: Scotch warrants closed at 46s. 7d.; Middlesbrough, 37s. 8d. cash, and hematite, 47s. 9d. Copper, easier: Chili bars, G. O. B.'s and G. M. B.'s closed at £43. 2s. 6d. to £43. 7s. 6d. cash, and £43. 10s. to £43. 15s. three months. Tin, easy: Straits closed at £60. 5s. to £60. 15s. cash, and £61. to £61. 10s. three months. Australian, £61. English ingots, £64. Lead, firm: Spanish, £11. 3s. 9d. to £11. 5s. English, £11. 7s. 6d.; Silesian spelter, ordinary, £14. 7s. 6d. Nickel, 1s. 2½d. Antimony, £30. Quicksilver: first hands, £7. 7s. 6d.; second hands, £7. 4s. Copper shares, quiet: Cape, 2½ to 2½; Copiapo, 2 to 2¼; Libiola, 2½ to 2½; Mason and Barry, 2½ to 2¼; Rio Tinto, 17½ to 17½; Tharsis, 4¼ to 5.

GLASGOW, WEDNESDAY.—Market easier, with good business. Scotch done at 46s. 7½d. and 46s. 7d. cash, also at 46s. 9½d., 46s. 9d., and 46s. 9½d. one month; closing with buyers at 46s. 7d. cash, sellers ask 46s. 7½d. Cleveland done at 37s. 11d. one month; closing with buyers at 37s. 8d. cash, sellers ask 37s. 8½d. Cumberland hematite done at 47s. 11d. cash, also at 48s. 1½d. and 48s. one month; closing with buyers at 47s. 9d. cash, sellers ask 47s. 9½d. Middlesbrough hematite closes with buyers at 45s. 8½d. cash, sellers ask 45s. 9½d.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is steady, but there is not very much doing. Chief business has been in hard oils at £18. 10s. transit for February-March. There is no alteration in the price of olive, but there has been a limited business doing. Linseed is firmer, Liverpool makes now being held for 20s. 9d. to 21s. per cwt., in export casks. Cottonseed has fallen, and is quiet even at the reduction. Liverpool refined is now quoted 17s. 6d. to 17s. 9d. per cwt. There is a good market for good seconds. Castor oil is a fraction easier, closing steady at 2½d. First pressure French 2½d. per lb., but inclined to fall. There is nothing fresh to report concerning tallow. Resin is steady. Common continues in good demand at full prices, but the finer grades are neglected. Spirits have been moving fairly well, last week's price of 21s. 6d. per cwt. still being current. Petroleum quiet; prices both for American and Russian being purely nominal, at about quotations last given.

COLOURS are steady, without alteration in prices. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

OILS.—Business continues good, and the momentary difficulty appears to be getting delivery of goods after having bought. The import of linseed during the week has been 7,230 quarters, and with the prospect of small supplies for the next few weeks, linseed has experienced a smart advance in price. The import for the year has been 53,776 quarters, as against 17,867 quarters a year ago. Linseed oil has advanced in price about 10s. per ton, closing steady on spot at 19s. 4½d. naked; February-April or May-August worth 19s. 1½d., and September-December 18s. 9d.; boiled and refined from £1. to £2. per ton extra. Export for the week has been 2,240 cwt. During the week the import of cottonseed has been 4,882 tons from Alexandria, making a total for the year of 22,021 tons, against a year ago 19,355 tons. Refined cotton oil about 10s. per ton higher, the closing quotation on the spot being 15s. 7½d. naked; February-April, 15s. 9d.; and May-August, 16s. 3d. to 16s. 7½d. per cwt. Crude worth 14s. 1½d. Casks, £1. and ordinary barrels 30s. per ton extra. The export for the week has been 6,560 cwt. Spirits of turpentine, 22s. 3d. per cwt. Castor oil steady. Olive oil unchanged. Cod oil from £16. to £19. per ton. Sperm oil from 23s. Neutral liquid soap, £15. per ton. Mineral oil, very limited supply. Sweet fat, £26. 10s. per ton. Locomotive grease, £12. per ton.

CAKES.—Linseed cakes dearer, in sympathy with seed: 95% pure, £6. 7s. 6d. to £6. 10s. Oil cakes, £5. 5s.; Russians, £5. 17s. to £6. per ton. Cotton cakes are also dearer: best makes, £3. 15s.; seconds, £3. 10s. to £3. 12s. 6d. Rape cakes: Black Sea, £2. 7s. 6d. to £2. 10s.; East India, £3. 7s. 6d. per ton.

PAINTS.—Makers continue busy, and the situation generally is unchanged. Prices are:—White and red lead, also oxide of zinc, unchanged. Dry mineral colours, £3. 10s. to £8. per ton. Ready-mixed paints from £24 per ton. Paint remover, 25s. per cwt. Natural belt dubbin, 12s. per gallon. Oak varnish, 5s. 6d. per gallon.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

Since the break-up of the solid paraffin combine the prices have been reduced by all the makers. There was a kind of informal understanding that the reduction need not exceed three-sixteenths of a penny per lb. all over, including both scale and wax, and the change of figures made below is in accordance with that. But unquestionably some of the makers are taking less, and, in short, for the time there is nothing definite in the market. Lubricating oils are all higher, because of the temporary interruption to the Russian supply of the article through the partial wreck of the railway from the Caspian to the Black Sea. Sulphate of ammonia was last week bought for £8. 7s. 6d., the lowest point yet reached, and it is thought that the influence of the Beckton clearing-out selling will force the price lower still, although to-day there seems to be a slight rally. The price views of Continental correspondents of late are lower than ever they were. General chemicals are unchanged; prices steady, and only a moderate business doing.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. 10s. nett, Glasgow; caustic soda, white, 76° £9. 5s., 70/72° £7. 10s., 60/62° £6. 10s., and cream 60/62° £6. 10s., all nett, Liverpool; bleaching powder, £6. 15s. to £7. 5s. nett, Tyne; saltcake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4¼d. less 5%, Liverpool; nitrate of soda, 7s. 6d. to 7s. 10½d.; sulphate of ammonia, £8. 7s. 6d. to £8. 8s. 9d. prompt, f.o.b. Leith; salammioniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £15. 12s. 6d. to £15. 15s., less 5%, Liverpool; paraffin scale, hard, 1½d., and soft, 1½d. to 1½d. per lb.; paraffin wax, 120° semi-refined, 2½d. to 2½d.; paraffin spirit (naphtha), 7½d. to 8d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6¾d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 86½° £5., 88½° £5. 10s. to £6., and 89/89½° £6. to £6. 10s. Week's imports of sugar at Greenock were 4,194 bags beet unrefined.

### TYNE CHEMICAL REPORT.

TUESDAY.

In chemicals the tone of the market is still very quiet, though sales show a slight improvement. Soda crystals are £2. 2s. 6d. per ton, gross weights locally. Caustic soda, 76/77°, £9. 5s. per ton; 70%, £7. 10s. to £7. 15s. per ton. Sulphur scarce at £3. 17s. 6d. per ton. Other quotations as under:—

Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett; caustic soda, 76/77°, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, nett weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

SALT.—South Durham salt is steady at 9s. 6d. per ton, f.o.b. Tees, for common.

COALS.—Trade is quiet, though sales of small steam coals are reported at higher prices. Coke is in fair demand, both for export and inland. To-day's prices are:—Best Northumbrian steam, 7s. 9d. to 7s. 10½d. per ton; second qualities, 6s. 9d. to 7s. per ton; small steam, firmer, 3s. 7½d. to 4s. per ton; Bunker coals, steady, 6s. 3d. to 6s. 6d. per ton; gas coals in full demand, 7s. to 7s. 6d. per ton; household coals, dull, 10s. to 11s. per ton; coke, firm, 14s. to 15s. per ton.

### New Companies.

**Fras y Go Salt Glazed Brick Co., Ltd.**—CAPITAL, £3,000, in £5. shares. This company has been formed to acquire certain land in Denbigh, and to carry on the business of salt and glazed brick, tile, and sanitary ware manufacturers.

**Metropolitan Paper Co., Ltd.**—CAPITAL, £12,000., in £1. shares. This company has been formed to acquire and carry on the business of paper makers, &c., now carried on at Merton Abbey Mills, Merton, Surrey. The subscribers to the memorandum of association are:—H. E. Edlmann, 17, Newton-road, Westbourne Grove, W., clerk; W. F. K. Underwood, 150, Fenchurch-street, E.C., secretary; E. Mabey, jun., 23, Lime-street, E.C., merchant; J. Goodey, 24, Norman-road, Wimbledon, clerk; J. Jones, 3, Wandle-road, Merton, paper maker; R. B. Hough, London Wharf, Ratcliffe, E., merchant; R. Hough, London Wharf, Ratcliffe, E., merchant.

**Alyn Steel Tinplate Co., Ltd.**—CAPITAL, £12,000., in £50. shares. This company has been formed to acquire the business of the Alyn Steel Tinplate Co., at Mold, Flintshire, and to carry on the business of ironmasters, tinplate and alkali manufacturers, etc. The subscribers to the memorandum of association are:—Mrs. E. Morgans, Alyn House, Mold; J. T. Morgans, Grosvenor-street, Mold, manager; Mrs. D. Williams, Caerfynnon, Mold; D. Williams, Caerfynnon, Mold, manager; Mrs. H. J. Roberts, High-street, Mold; H. J. Roberts, High-street, Mold, grocer; Miss M. Williams, Bromfield Hall, Mold.

SUBSCRIBERS ARE REQUESTED TO NOTE THAT THE

## INDEX and TITLE PAGE for VOL. XVII.

WILL BE ISSUED WITH NO. 457, FEBRUARY 22, 1896.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

**"Expert, Manchester."**

**NATIONAL TELEPHONE 3060.**

Readers will oblige by making their remittances for subscriptions by Postal or Post Office Order, crossed and payable to "Davis Bros."

Articles, reports, and correspondence on all matters of interest to the Chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

10 Words and under .....

Each additional 10 words .....

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

10 Words and under .....

Each additional 10 words .....

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff rates, which will be forwarded on application.

Advertisements intended for insertion in the current week's issue should reach the office by Thursday morning at the latest.

## CURRENT TOPICS.

### THE AMERICAN CHEMICAL TRADE.

THERE have been a good many changes in the past year in the chemical trade in this country, changes that have mainly been due to the advances that the Solvay Process has been making, and it would seem the American branch at Syracuse has not been standing still either.

As far back as 1893 the company determined to increase their output, which meant enlarging their works. Owing to various reasons, one of which was the great depression that prevailed during that year and 1894, the proposed changes progressed but slowly. The alterations have now, however, been completed, and the increased plant brings the total capacity of the works up to 500 tons of soda ash per day. To supply the raw materials necessary for this increased production other developments have been called for, so that the company have bored additional wells for the supply of brine, and have enlarged their coke-oven plant to a capacity of 120 tons of coke per day. In conjunction with these alterations the office buildings have been extended and a handsome laboratory, fitted inside on the latest and most approved principles, has been erected.

Another enterprising move has been the acquisition of the Onondaga blast furnaces, and now on the adjacent land the company are erecting a gas producer plant capable of carbonizing 1,000 tons of coal a day, the gas being employed as fuel throughout the works.

Apart from these by no means insignificant developments, another far more extensive departure was begun last year. Owing to the rapidly increasing demands of the chemical trade in the West, this company decided to take time by the forelock and prepare themselves to provide for the needs that are being made manifest day after day. Consequently the company acquired about 400 acres some little way outside of Detroit, Mich., which has direct communication with all the main trunk lines as well as excellent water carriage conveniences, including a thousand feet of deep water docking.

On this property the company are busy erecting a plant to produce 200 tons of ammonia soda per diem. An idea of the energy that is being exercised can be gathered from the fact that though the works were only started late in 1895 the company are confidently counting on having the whole complete before the end of this year. Brine wells have been sunk on the property, and those that have been finished are, so far, very promising.

At Dunbar, in the Connells ville coke district, Pennsylvania, the company are also putting down 50 Semet-Solvay coke ovens fitted with the requisite plant for recovering the by-products, such as ammonia and benzol, &c. The recovery of the former is of special importance, as it is well known that ammonia is one of the most costly items in the Solvay process. The initial tests of these ovens were very

interesting. The coke from 2,000 lbs. of coal was tested pound for pound with best selected Connelsville bee-hive-oven coke, and proved equal in efficiency for all smelting purposes. The Semet-Solvay ovens, besides giving 15 to 20 per cent. more coke than the bee-hive ovens, gave 21 lbs. of sulphate of ammonia and 100 lbs. of tar per ton of coal. The 160,000 cubic feet of producer gas obtained per ton, heats the ovens for next to nothing, each oven carbonizing six tons of coal a day.

To fully appreciate the magnitude of the various developments it is desirable that some estimate of the present status of the company be arrived at, and this can, we think, readily be done by the aid of the following figures, which represent the condition of the company at the moment:—The capital is £800,000.; the producing capabilities 500 tons of soda ash per day. There are 3,000 men and 15,000 steam horse power employed to produce this amount of ash, the combined energies of which are expended in manipulating 1,000 tons of coal per day, 1,200 tons of limestone, and 800,000 gallons of brine.

#### ANOTHER NAIL IN THE COFFIN.

As the opening of Parliament approaches, we are drawing nearer to the time when, if all goes well, the discussion of the safe flashing point of burning oils will be re-opened. The necessity for this being done will have been once more impressed upon the minds of those who give any thought to this matter, by the advertisements that have recently appeared soliciting tenders for the supply of mineral oil to Trinity House for use in lighthouses. The old stipulations are still in force, for the advertisement states that the 135,000 gallons required must have a flashing point of not less than 145° or more than 160° F. by the close test.

Since the Government advisers are so certain that a 73° oil is all that can be desired for use by the general public, we suppose Trinity House will now begin to mend its ways, and Lord Rayleigh, as their newly-appointed scientific adviser, will see that the way is opened for the introduction of a lower flashing oil. It hardly seems necessary in a lighthouse, where everything is done methodically and with care, to use an oil which is safer than that being used daily in thousands of dwelling-houses in a careless, off-hand way, by ignorant and thoughtless people. But this anomaly is, of course, merely a freak; and counts for nothing. We are being constantly told that all the fault lies with the lamps, not the oil, a truth (?) which even the *Lancet* seems at last to have swallowed. We are open to conviction, but we cannot accept this lamp theory unless those who advocate it will pledge themselves to alter all the lighthouse lamps into "safety lamps," in which nothing but 73° oil shall be burned.

The lamp "improvers" are constantly trying to show (with meagre success, it is true) that the high-flash oils are more dangerous than the low, and they are certain that 73° oil in one of the County-Council-modelled lamps, is quite safe. And so are we certain it is safe—quite as safe as gunpowder in a match factory. There are degrees of safety. To be in keeping with the cocksure assertiveness and assurance of the low-flash advocates, the above must surely be the "positive" degree, and we would fain reach the comparative before feeling safe.

But to return to the assumed danger of high-flash oil; if this assumption is true, what a terrible risk Trinity House runs in using such fatally high-flash oil for their lighthouses, and how imperative it is that, on behalf of the public safety, the lamps should be re-modelled on the latest C.C. lines, and burn low-flash oil. It is the only natural deduction, and yet

we would dare the leaders of the low-flash party to advocate this obviously needful step being taken, either by the Government or Trinity House. No! that would be another thing altogether to distributing dangerous oil broadcast (at a fat profit) among poor and ignorant people, for the loss of whose lives in hundreds a year, neither officials, importers, or vendors can at present be held responsible. Refuge can always be taken behind the Government, who test and virtually guarantee the lot.

There is just one other point. The entire high-flash movement is attributed to the enfeebled condition of our insular mineral oil industry. This belief, and many wilfully misleading hints about the substitution of fair trade for free trade principles, we have explained and dispelled *ad nauseam*, but we would further point out that this country is not alone in thinking 73° oil dangerous, no matter where it comes from. Many of the States in America have laws which speak for themselves, and Holland is now seriously thinking of forbidding the importation of any oil flashing below 104° F. We only ask for 100°. We therefore desire it to be clearly recognised that the high-flash movement is *not* only and solely supported by a few self-seeking, money-grubbing, fair trade fanatics, but by a number of honourable disinterested scientists and public men whose sole aim is the establishment of the truth, be it favourable to their opinions or not. Such men have and will spend time and money in carrying their quest to finality, and we insist that this ultra-trade support be reckoned with in judging the statements of the deeply self-interested low-flash partisans. If the testimony of all monetarily or officially interested parties on both sides were taboed the truth of this long disputed question would soon be reached—much too soon for the S.O. we opine.

#### ANTI-ADVERTISING.

All those who use printer's ink and paint as a means of gaining publicity have been getting it hot from the National Society for Checking the Abuses of Public Advertising. After reading the strictures of the president, Mr. Waterhouse R.A., we hope they all feel heartily ashamed of themselves, and feel they are a disgrace to the nation. If not they ought to do, for Sir Lepel Griffin hath spoken, and, as the bard saith, "I am Sir Oracle, and when I ope my mouth let no other griffin growl"—or something to the same effect. A lot of other pretty and complimentary things were likewise said, and the fate of the advertiser doomed. We do not think there will be any need to convene opposition meetings, at which to play battledore and shuttlecock with pointed epithets and fancy phrases, in order to doom the Bill which this worthy society intends to commend to Parliament. We can jog along the same old path and leave that to those who still want their morning's news for a penny, and 'bus and tram fares at the same humble rate, and lastly to the poor overburdened agriculturists. Mr. F. C. Rasch, M.P., is a host in himself, and with him are the agriculturists to a steam plough tender. To use his own words, what are the distressed agriculturists to do? They grow wheat at 40s. and sell it for 20s., pay rates and taxes for the whole countryside, have to keep the Establishment on its legs, and yet, according to these æsthetic theorists, may not turn an honest penny by letting advertisement spaces. We really cannot tell Mr. Rasch what they *are* to do, but we are confident of what they *will* do—they will "do" for the N.S.C.A.P.A.'s Bill. Suggestive letters those when you think them over. National Society for Controlling Advertisers' Private Affairs is not bad for a start. If the society must be so busy let it concern itself first with the offenders in their president's

craft, and ostracise every artist who has painted an advertisement, or allowed his finished canvas to be used for such a purpose, which naturally suggests as another reading: Never Served a Customer when Asked to Paint Advertisements.

It wants no society to check injudicious advertising. It defeats its own end. The latest telegraphic development has already damaged the house that started it, and dealt sudden death to itself, which fact renders excusable this third and final interpretation: The Nation Single-handed Can Abolish Pernicious Abuses.

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

Improvements in the Construction of Wooden Grids for Gas Purifiers. J. Hawley. 1,351. January 20.  
Apparatus for Degreasing Wool, etc. F. N. Turney. 1,370. January 20.  
Improvements in Filters. S. D. Rowland. 1,399. January 20.  
Removing Pitch from Casks, etc. A. J. Boulton. 1,412. January 20.  
Improvements in Utilisation of Weldon Mud and other Was es from Alkali Manufacture. P. C. Bunn. 1,417. January 21.  
Discharging Residues from Zinc and Spelter Furnaces. H. Martin. 1,454. January 21.  
Charging Retorts in Zinc or Spelter Furnaces. H. Martin. 1,455. Jan 21.  
Manufacture of Sodium Cyanide. J. F. Hutcheson. 1,458. January 21.  
Utilizing Coke oven and other Rich Gases for Manufacturing and Heating. J. T. Brunner and H. Brunner. 1,501. January 21.  
Improved Apparatus for the Treatment of Sewage. W. D. Scott-Moncrieff. 1,545. January 22.  
Utilising Lead Oxide in the Preparation of Battery Elements. D. G. Fitzgerald and C. N. Stewart. 1,564. January 23.  
Safety Valve for Vessels used for Storing or Conveying Compressed Gases. M. Crawford. 1,639. January 23.  
Manufacture and Purification of Ammonium Nitrate and other Salts. T. Fairley. 1,667. January 23.  
Manufacture of Ammonium Nitrate and Sodium Salts. T. Fairley. 1,668. January 23.  
Improved Apparatus for Purifying and Treating Water and Sewage, etc. W. Digby. 1,677. January 23.  
Improvements in Electrodes. W. Digby. 1,678. January 23.  
Manufacture of Disinfecting and Bleaching Agents. W. Digby. 1,679. January 23.  
Improvements in the Manufacture of Salt. F. Perez. 1,729. January 24.  
Manufacture of Briquettes. J. C. Mewburn. 1,750. January 24.  
Gas Carburetted Apparatus. C. C. Walker. 1,817. January 25.  
Manufacture of Edible Fat from Coprah Oil. M. C. A. Ruffin. 1,827. January 25.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal and ALL RIGHTS OF PUBLICATION ARE RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in the Manufacture of Chlorates of Sodium and Potassium. J. Hargreaves, of Farnworth-in-Widnes, and Thomas Bird, of Cressington. Eng. Pat. 18,926. October 1, 1894.

The chlorate is made by passing  $\text{Cl}_2$  into a solution of caustic soda, sodium carbonate or bi-carbonate. The absorbing vessels are specially constructed and fitted with agitators. The  $\text{Cl}_2$  gas is passed through these so that the gas enters where the conversion into chlorate is almost completed. During the reaction sodium chloride is deposited, and when  $\text{Na}_2\text{CO}_3$  is used some bicarbonate. To render all the soda available, the agitators are employed. To separate the chlorate from the salt the contents of the absorber are run off into a filter or centrifugal, steam in either case being forced downwards through the residual mass of chloride. The solution so obtained is evaporated to a strength of 100° or 120° Tw., and run into crystallisers. When the chlorine has to be aspirated through the absorbers by an exhaustor, the exit gases are passed over soda, or other suitable medium, to remove all traces of  $\text{Cl}_2$  gas that may have passed away unabsorbed. There are five drawings, showing the details and general arrangement of the plant used.

Improvements in Apparatus for Obtaining Cyanides from Gases. W. Foulis, 45, John-street, Glasgow, and P. F. Holmes, Tunbridge Ironworks, Huddersfield. Eng. Pat. 15,168. Aug. 12, 1895.

This patent provides apparatus for the execution of patent 9,474/92. Iron scrap is dissolved in acid-proof tanks by aid of  $\text{HCl}$  and the solution of chloride lifted by a steam jet into a store tank, from which it runs into a series of tanks containing carbonate of soda, thereby form-

ing carbonate of iron. After settling, the clear liquor is removed by "loose-legs," more alkali added, and the whole pumped or otherwise lifted into a mixer, fitted with revolving paddles, and then run into two horizontal rotary scrubbers, which are a modification of the W. C. Holmes type. The gas, freed from ammonia, is passed through these scrubbers, the cyanides being fixed as ferrocyanide. The liquor is pumped into a tall settling tower, and the clear liquor drawn off into the evaporators. The resulting cake is treated according to the patent referred to at the outset. There are two drawings—one in plan and the other in elevation (part sectional elevation).

Improvements in Purifying Oil Extracted by Solvent from Linseed and similar Substances. W. T. Whiteman, 7, Staple Inn, Middlesex (communicated by Cleveland Linseed Oil Co., Ohio, U.S.A.). Eng. Pat. 23,106. Dec. 3, 1895.

In the usual method of removing the solvent, such as naphtha, which has been used in the extraction of oil, the temperature at which the evaporation of the solvent is effected coagulates the mucilaginous or albuminous constituents of the oil. To obviate this, the dry heat of low-tension steam is employed, the naphtha being removed at a temperature of 140° F. The process is conducted practically in two stages, in the former of which the volume of steam, and consequently the temperature, is kept lower until the second stage, which begins when the bulk of the naphtha has been removed. There are three drawings.

Process for Manufacture of Cyanides out of Molasses, and Lyes resulting from Beetroot Molasses. Dr. H. Reichardt and J. Bueb, both of Dessau, Germany. Eng. Pat. 7,171. April 8, 1895.

Hitherto the attempts made to utilize the gases from the dry distillation of molasses and the lyes of beetroot molasses have aimed at recovering the valuable constituents in the form they occur in the gases—namely, as ammonia and methyl compounds. The crude gases have a very bad smell, and the present process provides for the removal of this smell and the recovery of the nitrogenous compounds as cyanogen. To do this the crude gases are passed without cooling through a system of white-hot fire-brick channels, air being excluded, whereby the nitrogenous compounds are converted into cyanide of ammonia and a little carbonate of ammonia. By passing through a solution of an iron salt, the cyanogen is fixed as ferrocyanide. The carbonic acid gas and sulphide of hydrogen in the gases are also rendered fit for utilization.

An Improved Detergent or Washing Powder. J. T. A. Walker, The Laboratory, Rishon, near Blackburn. Eng. Pat. 3,466. Feb. 18, 1895.

In order to prepare a harmless but active preparation of ammonia suitable for laundry purposes, a mixture of sulphate of ammonia and bicarbonate of soda is used, the ammonia salt being coated with paraffin wax, so that the ammonia is not evolved until the soap is used in hot water. When used with a superfatted soap 10 per cent. of the above mixture is added to the soap base.

ANOTHER FALL IN CANDLES.—The Scotch oil trade, owing to the severe competition offered by English makers, have intimated a further reduction of 3d. per dozen pounds in the price of candles, making a reduction of 6d. per dozen pounds since the beginning of the year.

PERSONAL.—Mr. Charles C. Moore, F.S.C., informs us that he has commenced business as Analytical and Consulting Chemist, at Harley Buildings, 11, Old Hall-street, Liverpool. Telephone No., 6,538. Mr. Moor has for a long while been employed by Messrs. Brunner, Mond, and Co., and has thus had a wide and practical experience.

NITRATE STATISTICS.—The Permanent Nitrate Committee's public statistical circular for February shows that the total exports to Europe during January were 1,735,000 quintals; loading for Europe, 1st February, 1,124,000 quintals; imports (Europe), January, 135,230 tons; deliveries in Europe, January, 62,580 tons; visible supply (Europe), 1st February, stocks and afloat, 673,700 tons.

THE "CUMMER DRYER."—We are informed that the Cumber Drying Machines and system have been adopted at Colonel North's Portland Cement Works, Antwerp, well-known to be one of the best equipped works in the world. The two dryers are each evaporating two tons of moisture per hour, using less than 4 cwt. small coal. Among other important sales and shipments made in January, Messrs. Charles Erith, of 70, Gracechurch-street, advise us of the following:—

|                                   |                           |         |
|-----------------------------------|---------------------------|---------|
| Cummer dryer for superphosphates, | Petit-Quevilly, France... | £ 370.  |
| Cummer dryer for ochres,          | Llanely, Wales            | .. 420. |
| Cummer dryer for clay,            | Glasgow, Scotland         | .. 300. |
| Timber drying apparatus,          | Esslingen, Germany        | .. 238. |
| Ditto                             | Hamburg, Germany          | .. 135. |
| Ditto                             | Bilbao, Spain             | .. 135. |

as well as orders for heating apparatus and pumps, &c.

25112AA

## MERSEY AND IRWELL JOINT COMMITTEE.

A MEETING of this Committee was held on Monday at the offices, Mosley-street, Manchester. Mr. Alderman J. Thompson presided. The Consulting Sub-Committee, through Mr. T. W. Killick, reported with regard to the sewage schemes of a number of local authorities—Bury, Aspull, Hollingworth, Hayfield and Wilmslow. With regard to Bury, it was stated that the Town Clerk of that borough had notified his intention to apply to the court for a further extension of time. The Town Clerk and the clerk to the Committee, however, had not yet arranged a date suitable to both parties on which to make the application. The Committee recommended the adjournment of the matter for a month. Of the Aspull authority the chief inspector reported that good progress was being made at the Wigan sewage farm. The Committee, therefore, recommended that the consideration of the position of this authority be adjourned for three months. From the clerk to the Hollingworth authority a letter had been received. The Committee were of opinion that it was not satisfactory, and they recommended that proceedings be taken for offences under the Act, but that the clerk withhold the proceedings for fourteen days "to enable the authority to agree with the vendor of the land for the outfall works as to the title." A letter had been received, the Sub-committee reported, from the Hayfield Rural District Council, but it did not state that instructions had been given to the surveyor to prepare the necessary plans. The Committee recommended that proceedings be taken against this authority, but that the clerk withhold them for a month, to enable the Council to take the requisite steps in the matter. The Wilmslow Urban District Council wrote informing the Committee that contracts had been made for carrying out the necessary works in the district, and that good progress was being made. The Council, however, found that the works could not be completed by February 1st, the date on which the time allowed by the justices expired. They asked that the time should be extended until June 30th next. The Sub-committee recommended that the clerk should inform the Council that if they would apply for a reasonable extension of time the application would not be opposed by the Joint Committee.—All these recommendations were adopted by the Committee.—Sir H. Roscoe reported on the analyses of the effluents from the works of twenty-two authorities, taken during the past month. Of these 16 were stated to be good effluents, three fair, two unsatisfactory, and one bad. With regard to the unsatisfactory effluents, which were taken from Hindley and Offerton (Stockport Rural District Council), the Sub-committee recommended that the clerk be instructed to write and call the attention of the authorities to the matter, and to state that the committee required some improvement. In the case of the bad sample, taken from the Knutsford works, the Sub-committee recommended that the clerk should inform that Council that "as they are a new authority, the Committee have not on this occasion taken any action against them, in the hope that they will, without delay, take the necessary steps to make their works more efficient; and that, failing this, proceedings will be probably taken."—The report was adopted.

## MANCHESTER CHAMBER OF COMMERCE.

## REPORT OF CHEMICAL SECTION.

THE Executive has met five times since the last annual meeting. The principal subjects which have engaged its attention are the following:—Lead poisoning and the preparation of chrome-lead colours; The Steam Engines (Persons in Charge) Bill; Patents, Designs, and Trade Marks Act Amendment; and The Factories and Workshops Act Amendment Act. The possible danger to health incurred by the makers of chrome-lead colours, and by the wearers of articles coloured with such preparations, was the first subject considered by the Executive. After thorough discussion and comparison of a set of sample textiles, which had been prepared by the chairman, wherein, in the one case chrome-lead colourings, and in the other aniline or some other innocuous dye had been used, the Committee unanimously adopted a series of resolutions which have already appeared in the *Journal*, No. 413, p. 257. In connection with *River Pollution and Smoke Prevention*, the Committee desire it to be understood that, in its opinion, the method at present pursued by the Mersey and Irwell Rivers Committee in proceeding against manufacturers for the alleged pollution of streams is open to very serious objection, as being prejudicial to the interests of trade, and consequently to the interests of the community in general. It commends this subject to the new Committee for careful attention. There can be no doubt that an attitude of greater consideration for manufacturing interests would, in the long run, bring about more satisfactory and abiding results than the drastic measures the Rivers Committee seem disposed to adopt. As an example of the utility of the lenient method of treatment suggested by your Committee, reference may be made to the present

relations between the city authorities and the owners of erstwhile smoky chimneys. It is allowed by all who have any acquaintance with the subject, that the recognition by the authorities of special difficulties on the part of the manufacturers, the rendering of mutual assistance, and the cessation of vexatious proceedings has effected an enormous improvement in the out-turn of black smoke from the chimneys of chemical and other manufacturers. It cannot be doubted that, if the enlightened example of the Manchester Corporation in this respect be followed by the Mersey and Irwell Committee, similar efficacious results will follow with regard to the streams of the Mersey and Irwell watershed.

The Committee regret to note that with the close of their present year of office they will not be at liberty to re-elect Mr. Ivan Levinstein as chairman, nor Mr. Thomas Jackson as deputy-chairman. Both gentlemen have served the Committee in these positions since its formation as the first Sectional Committee of the Chamber, four years ago. Mr. Levinstein (who was the main instrument in the formation of the Section) retires, it is understood, on account of the pressure of other work, whilst Mr. Jackson's retirement is caused by ill-health. In the meantime it is satisfactory to note that the membership of this, the oldest of the Trade Sections of the Chamber, has considerably increased during the year.

## EXPORTS OF ALKALI AND BLEACH.

THE following figures, which are taken from the official foreign and colonial statistics of the United Kingdom, give the amount and value of alkali and bleaching materials shipped to the undermentioned countries during the year ending December, 1895, as compared with 1894:—

| ALKALI.                  |           |           |           |           |
|--------------------------|-----------|-----------|-----------|-----------|
| Port.                    | 1894.     | 1895.     | 1894.     | 1895.     |
|                          | Cwts.     | Cwts.     | £         | £         |
| Russia .....             | 198,500   | 194,738   | 72,280    | 62,115    |
| Sweden and Norway ....   | 135,700   | 159,689   | 28,294    | 33,213    |
| Germany .....            | 127,300   | 112,198   | 42,492    | 32,560    |

## PETROLEUM EXPLOSION ON A STEAMER.

A DISASTROUS explosion occurred last week on board the barque *British Army*, owned in Liverpool by Messrs. Gillson and Chadwick, lying laden at Barry Dock, Cardiff, a man named White and a boy being killed, and a number of men who were working the cargo severely injured. The *British Army*, a barque of 1,338 gross tonnage, was moored at the western wall of the basin at Barry Dock in order to discharge a cargo of pitwood. The cargo had been discharged, and a gang of men were employed to clean out the hold and the bilges. It appeared that the previous cargo carried by the ship had been petroleum, and a considerable quantity of the oil had leaked to the bottom of the boat and lay to the depth of several inches in the bilges. About three o'clock one of the men, named Martin, was in the act of removing lumber boards, when a terrific explosion was heard, followed almost instantly by another report, both being heard for a considerable distance. On a number of men going down into the hold to ascertain the effects of the disaster they found two dead bodies fearfully burnt, one being Thomas White, junr.; the boy killed was subsequently identified as David Jones—both belonging to Barry. The following were severely injured:—Thomas White, Wm. Finlayson (chief mate of the barque), William Brown, William White, and Henry Lloyd. Three of the men were removed to the accident hospital in Kingston-crescent, and two others, Wm. White and Henry Lloyd, were taken to their homes. The fire continued to burn on the vessel for some five or six hours.

## THE NEW RÖNTGEN LIGHT RAYS, WITH SHADOWGRAMS.

[SPECIALLY CONTRIBUTED.]

COINS ENCLOSED IN LEATHER PURSE. EXPOSURE FOUR MINUTES.

FROG THROUGH SHEET OF ALUMINIUM. EXPOSURE, TWENTY MINUTES.

LIVING HAND THROUGH BLACK VULCANISED FIBRE. EXPOSURE, FOUR MINUTES.

SHADOWGRAMS BY MR. A. A. CAMPBELL SWINTON, REPRODUCED BY SPECIAL PERMISSION OF THE "PHOTOGRAM."

WHEN, a few weeks, ago a Vienna journalist startled the world by announcing that Professor W. K. Röntgen had been able to obtain photographs of objects enclosed in wood and other materials, hitherto considered opaque to light, the scientific world was rather sceptical, and the discovery was discounted by the wise-acres, by ascribing all the astonishing results that the Würzburg professor was said to have achieved, to the action of the well-known ultra-violet rays. In a measure this was pardonable, as it was known that the cathode rays of a Crookes' tube would pass through thin sheets of metal, and excite fluorescence when allowed to fall on paper saturated with platino-cyanide of barium; while by the interposition of specially-cut patterns, clearly defined shadows of the same could be obtained. The fuller particulars that have transpired however put another aspect on the matter, and it is now undoubtedly accepted that Professor Röntgen has made a very important discovery, which brings home to us how loose are our notions of the terms opaque and translucent, and how very finite our visual powers.

Professor Röntgen, in his communication to *Nature*, states that his new rays, or X-rays, are different to cathode or the present known ultra-violet rays. This statement has been confirmed by communications from different parts of the world, and it is now stated that Professor Silvanus Thompson has found X-rays in the electric arc. The chief points of dissimilitude between these X-rays and cathodic rays are that they are not deflected by magnets, do not diffuse readily, and pass through thicknesses of wood and metal which would absorb cathodic rays. Further, Röntgen contends, and apparently with justice, that the X-rays do not (like the cathode rays) proceed from the cathode itself, but from that part of the glass where the latter strike. Thus, if the cathode rays generated by a good vacuum tube are deflected by a magnet, the X-rays are seen to proceed from a fresh point. As compared with the visible infra red and hitherto known ultra-violet rays, the X-rays thus show negative properties, for they are not refracted by passing into water, carbon bisulphide, rock-salt or glass; cannot be polarised by any ordinary media; and are incapable of regular reflection at the surfaces of rock-salt, &c.

In their action on a sensitised photographic plate, the cathode and X-rays are alike, and this seems to be the only property that they have in common. The images obtained by exposing objects to these rays in front of a sensitised plate can hardly be correctly called photographs, being in reality shadowgrams, and as such we shall speak of them. Professor Röntgen has made very interesting experiments with these new rays: for example, paper is very transparent, the fluorescent screen will light up, when placed behind, a book of a thousand pages; printing ink offers no marked resistance. Similarly the fluorescence shows behind two packs of cards; thick blocks of wood are transparent; boards of

pine 2 or 3 centimetres thick absorb very little of the rays; glass plates of 15 m.m. thick behave similarly, though lead glass is much more opaque than glass free from lead. The specimens that we are able to reproduce here are shadowgrams taken by Mr. Campbell Swinton, and for which we are indebted to the *Photogram*, as well as for many interesting particulars. There are yet several points that have to be subjected to closer and more searching investigations, for Professor Röntgen deems it decidedly questionable whether the impression on the plate is the direct effect of the X-rays, or a secondary result produced by the fluorescence of the material of the plate. Though the transparency is not wholly determined by the density, yet, as a general rule, Professor Röntgen's experiments show that the permeability of different bodies is in proportion to their density.

**DANGEROUS EMPLOYMENTS.**—An order has been issued by the Secretary of State, under the Factory and Workshop Act, 1891, declaring that processes in the mixing and casting of brass, gun metal, bell metal, white metal, delta metal, phosphor bronze, and manila mixture are dangerous or injurious to health.

**REPORT OF THE GAS LIGHT AND COKE CO.**—The report of the company for the half-year ended December 31, 1895, states that the accounts show, after providing for all fixed charges, a balance of £524,091., out of which the directors recommend a dividend at the statutory rate of 12½ per cent. per annum, carrying forward £164,121. The consumption of gas by the ordinary customers has increased at the rate of 2.58 per cent., and that by the automatic-meter customers has been equal to a further increase of 2.28 per cent., making together 4.86 per cent. on the quantity sold during the December half-year, 1894. In order to provide for the expenditure in connection with the supply of gas by automatic meters and for further capital purposes the directors, in December last, offered for sale by tender a further sum of £100,000. ordinary A stock. The whole of this has now been subscribed for at or above the reserved price of £292. per cent. The prices realised during the half-year by the sale of coke and tar products may be considered, on the whole, favourable, and it is satisfactory to be able to report that the Board of Trade returns show that the cement manufacturers, who are considerable buyers of the company's coke, are participating very largely in the marked improvement which has taken place in the general export trade of the country. On the other hand, the market for sulphate of ammonia continues in a depressed condition, as is evidenced by the reduction in the company's revenue under this head, as compared with the corresponding figures for the December half-year, 1894.

## MANCHESTER CORPORATION AND THEIR GAS RESIDUALS.

THE Local Government inquiry upon the above subject, which was opened by Colonel Ducat, R.E., on Jan. 7th, was continued last Tuesday and Wednesday, and concluded on Thursday. Mr. Hudson, deputy town clerk, appeared on behalf of the Corporation. Mr. Sutton and Mr. R. Richards appeared to oppose on behalf of certain property owners and ratepayers and the Manchester and Salford and District Property Owners' Association.

The Assistant Town Clerk made a formal explanatory statement with regard to the application. He said that similar powers to those sought by the Manchester Corporation were possessed under certain Acts of Parliament by Barrow-in-Furness, Birmingham, Bradford, Leeds, and Leicester. The Corporation would take care not to exercise the powers in an arbitrary manner, or in such a way as would be a nuisance in the district of Bradford-road gasworks. The Corporation asked for thirty years in which to repay the proposed loan of £25,000.

Alderman R. Gibson said the question of the manufacture of sulphate of ammonia by themselves had been exercising the mind of the Gas Committee during the last twelve years, but it was only last year that the matter was brought to a head. Various causes tended to bring this about, but the main causes were the reduction of the price of gas to the extent of twopence per thousand cubic feet. That had decreased the profits of the works to no less an amount than £50,000 a year, and the committee had ceased to make a charge in the shape of rent for gas meters, which reduced the income of the committee by £10,000 to £12,000 a year. The Corporation also had a large electric lighting installation, which might become a powerful competitor to the gasworks, which were being managed in the best interests of the citizens. The committee had from twenty-five to thirty acres of unoccupied land for which they paid interest, and it had occurred to the committee that it would be wise on their part to develop the resources at their command for the benefit of the people.

Alderman Gibson was then cross-examined by Mr. Sutton, who first asked if he was right in understanding that the Manchester Corporation anticipate making a considerable profit by working up the residuals?—We expect to make a profit.

Have you prepared figures showing how the profit is to be made?—I think we can show that, too.

Some figures having been handed in, Mr. Sutton asked whether the Corporation were acting upon those figures?—I cannot say that. The figures were taken out as appearing to us to be of interest to-day.

Can you produce the figures upon which the Corporation have acted?—No.

May I take it that the Corporation have satisfied themselves that they will make a greater profit by manufacturing the bye-products than they receive by selling the residual products?—Yes.

Have you any figures which show the profit made by selling the residual products?—The annual statement shows the amount received. In this matter we rely upon the statement made by our own engineer.

Have you taken the opinion of any independent, impartial, practical man who has had experience and who is generally acquainted with the cost of putting down the plant required?—No! certainly not, except our own engineer. What we propose to do at present is to limit our attention to the manufacture of sulphate.

Why do the Corporation apply for powers which it is not their intention to put in force at present?—In order that we may put them in force when we feel disposed to do so.

Have you any plan of the land on which you propose to put down your plant?—Yes (the plan was handed in).

What is the size of this triangular piece of land?—Ald. Gibson (prompted by Mr. Stevenson), About 10,000 square yards.

It is a triangular site, therefore the corners would scarcely be capable of being utilized. Do you think it can be all made use of?—The whole of it can be utilised. On one side of the land is a canal, and on another a railway. The land is about a quarter of a mile distant from Philips Park, and it was purchased by the Gas Committee about twenty years ago. There are two sets of chemical works, Messrs. Hardman and Holden's and Mr. Lockwood's, nearer the Park than this triangular piece of land. (Cries of "No, no.")

Mr. Sutton said that appeared not to be so.

Have you made any inquiries about the sulphate market?—We know all about the market without making inquiries.

Perhaps, then, you will tell me what the prices of sulphate have been during the last ten years?—I must be excused answering a question like that. (Laughter.)

With regard to Messrs. Hardman and Holden's works. I believe that the firm have for many years worked up the ammoniacal liquor produced at the Manchester Corporation Gasworks; and that up to last year, when they could not compete against the amount offered, they took all the tar?—Nearly all.

They had extensive works for the manufacture of gas bye-products?—I don't know what is the extent of their works.

Did they not pay the Corporation £2,000 for laying down a line of pipes from the different gasworks to their own works?—The pipes were put down originally by Messrs. Spence.

But afterwards Messrs. Hardman and Holden put down fresh pipes, and although they paid for the pipes the pipes belong to the Corporation?—That is so.

Have you received a letter from Messrs. Hardman and Holden in which they stated that they were prepared to show that you received from them the highest price paid to any corporation for gas water and tar?—Yes, they said so.

And they undertook to prove it?—Probably they might say so.

Do you know as a matter of fact that Messrs. Hardman and Holden have been satisfied with an average profit of three per cent. in the gas tar and ammoniacal liquor, and that in 1894 they made a serious loss?—I do not know that at all.

Who is to be manager of the new works?—The Gas Committee have not yet fixed upon one, but personally I think we might get a manager for a salary of £200 a year.

What? A gentleman well acquainted with one of the most tricky trades in the kingdom? (Laughter.)—I am surprised to hear that it is a tricky trade. (Laughter.)

I mean tricky in the sense that the prices of the product vary from fifty shillings to fourteen per hundredweight.

The Rev. S. N. Perry, Mr. G. Worthington, and Mr. Guymer opposed the application because of the nuisance which they said would be created by the new works.

By Mr. William Maben: Are the committee satisfied that they have made the best of their opportunities in the past for obtaining the best price for their bye-products?

Alderman Gibson: Yes.

Do they consider that the laying of the underground pipes and permitting them to be used by one firm was a fair arrangement?—Yes.

Do you mean to say that the firm who has that advantage was in no better position than a firm who had not pipes, and had to pay for the carriage of the material?—Yes. The carriage would not amount to more than the cost of the pipes.

In addition to the pipes are there any other conditions of a restrictive character, which have operated against firms tendering?—All are served alike.

But perhaps all are not equally able to comply with the condition that £9,000 should be deposited with the Corporation before the contract for these liquors can be obtained.

Alderman Gibson said considering the great responsibilities at stake the committee thought it a reasonable condition.

Is it a fact that four per cent. interest has been allowed for the amount of deposit?—I don't know.

And you borrow money at two-and-a-half per cent.?—If we can we do.

Has any other contractor besides Messrs. Hardman and Holden ever succeeded in obtaining the contract for liquor and tar up to the past year?—Certainly.

You advertised for tenders for the liquor last year. How many tenders were sent in?—Only one. The tender of Messrs. Hardman and Holden.

Then it was the highest tender (Laughter.) You will agree with Mr. Sutton's statement that this is a tricky trade. I would like to know the amounts of the tenders sent in for tar in March last.

The Commissioner said he could not allow the question to be put. The inquiry was not intended to guide contractors as to their offers in the future.

Mr. G. E. Stevenson, C.E., cross-examined, stated he had had 25 years' experience in gas manufacture. He had also had experience in the manufacture of tar and gas liquor products. In sulphate in particular at Peterboro' and in South America. The plant was designed by himself at both places. He had been with the Manchester Corporation since October, 1891. He had examined in every detail the plant at Beckton and Sheffield. The land was quite large enough. The plant would be in two distinct portions, one for sulphate, and the other for dealing with their spent oxide for the manufacture of the sulphuric acid. The latter would be capable of producing 20 tons of vitriol per day, at 15s. per ton. The whole plant would cost £20,000, made up as follows:—*Acid plant*: Burners and shed, £2,500; Glover and Gay-Lussac towers, £2,000; chambers (five in number), £5,000; pumps, pipes, and accessories, £500. *Sulphate plant*: Boil-house, chimney, and lime shed, £2,000; three boilers, £1,400; sulphate apparatus, complete, £3,000; shed for same, £400; condenser, £600; lime tanks, £600; filters and settlers, £1,500; Devil liquor tank, £200; and pumps and accessories, £300. He estimated that the life of the acid plant would be 10 years, and that of the sulphate 20. In further cross-examination, it transpired that the total cost of the production at Leicester was £3. 18s. 6d., at Messrs. Hardman and Holden's £3. 9s., as com-

pared with the Corporation estimate of £2. 12s. 4d. This difference was attributed to the greatly-improved plant the Corporation would have to work with.—Mr. Sutton: Are you aware that Messrs. Hardman and Holden already claim to have the best available plant? I know nothing about that.—Supposing through later developments in the recovery of cyanides you have to fall back on pyrites, do they not contain arsenic? Do you suggest that you can make pyrites acid without causing any nuisance the same as with spent oxide? I am not experienced in the manufacture of sulphuric acid.—If you are not experienced in the details, and cannot go into these particulars, what is the worth of your figure of 15s. per ton for the acid? The worth is this, I know two large places where they are making it at this figure—one is Beckton.—Have you any one of your staff of chemists who have had anything to do with the manufacture of sulphuric acid? I do not know that we have.

On the resumption of the hearing, Mr. Stevenson was recalled for further cross-examination, but before the cross-examination was proceeded with Mr. Hudson said that since the last hearing Mr. Stevenson had prepared a revised estimate of the cost of making sulphate of ammonia, which he now desired to submit. This having been agreed to, after complaint from the other side that the revised figures had not been shown to them during the interval, Mr. Stevenson said that while he was still of opinion that the estimate he formerly submitted was approximately correct as a whole he desired to make some slight amendments in matters of detail. The total working expenses he now made out to be £2. 17s. 4d. per ton, as against his previous estimate of £2. 12s. 4d., an increase of 5s.

Mr. Sutton protested against the introduction of an entirely new set of figures, and proceeded to cross-examine Mr. Stevenson with the view of showing that the Corporation is making quite as much from the sale of ammoniacal liquor as it is likely to make by the manufacture of sulphate of ammonia. Attention was directed to the fact that during the past six months the return from the manufacture of sulphate at Beckton was only 1s. 8'63d., as against 1s. 9'81d. received for the ammoniacal liquor at Manchester, but in reply to this Mr. Stevenson said the Beckton and Manchester works were not "on all fours" in this matter, as the Gas Light and Coke Company had works scattered all over London, and from these works they had to send the liquor to the residual works at Beckton, which no doubt cost a good deal. He had always been aware that the published returns from Beckton were not as favourable as those from some other works. Mr. Sutton here suggested to witness that the cost of carriage was balanced by the absence of freight at Beckton for the finished sulphate, an expense the Corporation would have to bear.—Witness: I cannot say. With the best plant they could obtain, he believed the Corporation could make sulphate of ammonia at a profit, as he had previously indicated. He thought that the sum included for wages in his estimate of the cost of sulphate making was quite sufficient for the purpose. It was true that it was proposed to increase his own salary by £200. per annum, but that had nothing to do with the proposal to manufacture the by-products.

In the re-examination of Mr. Stevenson, letters were read from the Birmingham and Leeds Corporations denying that they had given up the manufacture of sulphate of ammonia because it was not profitable. The cause of Leeds giving up was that the plant the Corporation took over was so old and dilapidated it could be worked no longer.

[The conclusion of the evidence will be given next week.]

**EXTRACTING GOLD FROM PYRITES.**—According to the *Temps*, a discovery, which is likely to be of great importance to gold mining, has been made by a French chemist, M. de Rigaud, who, it is asserted, has found a cheap means of extracting nearly the whole of the gold contained in pyrites. The process, which is claimed to be a considerable improvement on the cyanide process, consists in subjecting the ore after crushing to the action of a powerful solvent compound of chemicals of a comparatively inexpensive nature. It is stated that if heat be applied during the process the gold becomes separated from the ore in a few hours, but in practice it has been found that the same result is arrived at in about two days by simply leaving the solvent to do its work unaided. M. Rigaud estimates that a mill capable of treating 500 tons of ore a day by his process could be built at a cost of £20,000. The apparatus necessary for the manufacture of the solvent could be erected for about £250., and the substance itself would cost about £60. a ton. As a ton of the solvent would suffice to treat 5,000 tons of ore, the cost of treatment would only be about 3d. a ton, exclusive of capital charges. The system of crushing would, of course remain as at present. It is not claimed for the process that it can be applied to every class of ore, but it is believed that it will be found available in the majority of cases, especially for the treatment of parings and residue. It remains to be seen whether practical experience will confirm the results of experiments in the laboratory.

## Our Book Shelf.

**HANDY READY RECKONER.**—Compiled and Published by K. Openshaw, Wyke Regis, Weymouth.

This reckoner is specially designed for the use of those who have to make calculations of wages and costs for which it gives the necessary details, for one to 300 hours, on a basis of 54 hours per week. Its main feature is its compactness, all the hours and rates being on eight pages; whereas in the majority of reckoners it takes one page for each rate, giving but a small number of hours compared with this reckoner. By this arrangement you can tell at a glance what the amount for any number of hours up to 300 is, without any calculation. From these few facts it is apparent that such a reckoner will be of great assistance to persons making estimates for prospective work, and for calculating the cost of work done.

**CHEMICAL RECIPES.** By The Atlas Chemical Company. 316 pp., containing nearly 1,000 recipes. Sunderland: Hills and Co. 1896.

Recipe books, as a rule, are not of any great value to those who wish to manufacture from the formulae given. The present work is, however, most emphatically an exception. Although chiefly interesting to the manufacturer on a small scale, there can be no doubt that the more important firms will find many useful hints and suggestions, which, in the hands of practical experts, may be turned to good account. To the small manufacturer, however, the book will prove invaluable. Not only are the recipes given, but full working directions are also added, directions which are the outcome of actual practice. The price may be thought at the first blush rather high, but a moment's consideration will show that it is by no means so, for it must be remembered that in purchasing a work of this nature the buyer gets "brains" for his money, and they ought to be paid for. The first part of the work deals largely with pigments, fluxes, enamels, and glazes for ceramic work, but many of the recipes given are applicable to other uses, and consequently the first portion must by no means be treated lightly by those who are not particularly interested in these manufactures. Part II. deals with recipes for the preparation of carbonated drinks, paints, metal polishes, and blackings; blues, varnishes, stains, and lacquers; glues and pastes; wood stains and polishes; printing, writing, stamping, and lithographic inks; soaps, dyes, and dyeing recipes for textile goods; ship compositions and paints; stains, dyes, and varnishes for leather; and last, but not least, a collection of recipes dealing with the preparation of minor dysalteries, such as starch gloss, baking, egg, and custard powders, pickles, spices, relishes, scents, toilet powders, and temperance beverages. It would be hypercritical to criticise prominently the few subjects which are treated somewhat superficially, for it must be admitted that for a work of its kind the errata is small, the text, with the exception of a few literals, being faultless. "An ounce of practice is worth a pound of precept," and, bearing this in mind, no one interested in any of the subjects enumerated above should fail to obtain this valuable handbook.

**LOCAL GOVERNMENT ANNUAL.** By S. Edgecumbe-Rogers. 270 pp. London: Local Government Journal Office. 1896. 1s. 6d.

There have been several improvements upon the last number of this useful annual. The main feature is still the "Remembrancer," in which the last day for fulfilling certain regulations of the law is indicated. The growth in the number of District Councils during the last year has been considerable, and no pains have been spared to include all the new ones in the list. There is also much useful information concerning the Local Government Board, London School Board, and County Council, as well as all the various Metropolitan Boards. The information brought together in this annual would otherwise have to be sought in the pages of two or three costly publications, a fact which makes it remarkably cheap for the price at which it is issued. Of all the Local Government handbooks and official directories we think this annual is far and away the best and cheapest.

**CALVERT'S MECHANICS' ALMANAC.** By J. Nasmith. 64 pp., with diagrams. Manchester: John Heywood. 1896. 4d.

This annual contains the usual collection of useful information. There is nothing very striking in this year's number, but there are several interesting articles, including those on Moisture in Steam in Horizontal Pipes, New Standards of Length at Mason College, Notes on Incrustation in steam boilers, Testing Engines and Boilers, and the utilization of the Niagara Falls. There are also diagrams showing the proportions of crane-hooks, pulley blocks, and shackles. For the price it is a very useful little compilation.

**LAW'S GROCERS' MANUAL.**—Compiled and Published by J. T. LAW. 842 pp., including index. Liverpool: 1895. 5s. 6d., net.

There is a vast amount of information scattered here and there through the numerous trade journals that are connected with the grocery and kindred trades. The object of the author has been to bring all this information together, and so provide a description of almost every article that can be met with in the trade. The names are given in all the known foreign languages, and, being arranged alphabetically, can be referred to with a minimum amount of trouble, cross references being frequent. There is also a fairly good index. At the end of the alphabetical list there is some additional information regarding licences, tables of foreign money and weights, and similar useful items. The title of the work is somewhat misleading, as it contains a lot of information about things outside the range of the grocery trade. The more strictly chemical descriptions are at times rather vague, not to say incorrect, but we do not think these items ought to be taken as typical of the reliability of the book, as there is much evidence to the contrary. The information given will be found of use to drysalters, oil and colour men, chemists, and many others, to whom we can honestly commend this work.

**CATALOGUES.**—*Messrs. Pott, Cassels, and Williamson*, Motherwell, near Glasgow.—This firm sends us a novel catalogue of their Weston Hydro Extractors, built upon pivot, and suspended self-balancing principles. There are also descriptions of several applications of these centrifugals to the requirements of the sugar industry, particular attention being merited by their improved steaming-out arrangement, whereby the basket can be steamed either outside or inside at will. They also give illustrations of various woven wire and perforated linings for centrifugals, in brass, iron, copper and zinc. The novelty of the get-up will do much to popularise this useful catalogue.

*Messrs. Easton, Anderson, and Goulden, Ltd.*, 3, Whitehall-place, London, and Erith, Kent.—This catalogue is nicely got up, and well and fully illustrated. Much space is devoted to the specialities of this well-known firm, notably their turbines, centrifugal and other pumps. The Grafton high-speed engines are also fully described. In the section on pulverizers and mining machinery, particular attention is drawn to the "Niagara Pulverizer," which has recently been introduced by this firm. At the end of the catalogue there is also an interesting collection of electrical machinery, while we notice that the firm give particular attention to the manufacture of cordite plant.

It is desirable to draw attention to the fact that since this catalogue was published, the company's telephone number has been altered to "No 4 Dartford."

## THE STATE OF THE CHEMICAL TRADES.

**FULL** time is being worked in chemical and white lead works in the Tyne and Wear district. The Durham coke-men are fairly busy, but the cement works are rather quiet. Salt-workers are busy in the Middlesbrough district. At Burnley and neighbourhood paper makers, stainers, and chemical works are well employed. There is plenty doing in the pulp and paper works at Barrow. There is no change in the chemical industry at St. Helens, but things are reported as improving at Runcorn and Widnes. The salt trade at Winsford continues very depressed as far as loose salt is concerned, but block salt at Winsford and Middlewich is better. The chemical trade has been normal. Seed crushing mills at Hull are now working continuously with two shifts. The paint and colour trade is quiet. At Wolverhampton, galvanisers and hollow ware enamellers are busy, as are also oil, colour, and varnish makers. The glass bottle trade is feeble at Brierley Hill, but flint is better. In Swansea and district copper and chemical industries are dull, but there is plenty doing in the patent fuel trade.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are easier, 90's now standing at 2s., and 50/90's at 1s. 8½d. Otherwise there is practically no change in the market, carbolic acids being firm. Crude naphtha stands at 10d., a nominal price, values depending on quality; solvent, 1s. 6d. Pitch weak at 35s. 6d. to 36s., f.o.b., East Coast.

Sulphate of ammonia is rather firmer, with a fair demand. London makers having advanced their values, prices are more settled. Beekton stands at £8. 10s., the same figure holding good for London outside makes. Liverpool £8. 8s. 9d., Hull £8. 8s. 9d., and Leith £8. 7s. 6d. to £8. 8. 9d., all prompt. Nitrate firm.

## THE METAL MARKETS.

**LONDON, WEDNESDAY.**—Pig iron, dull: Scotch warrants closed at 47s. 2½d.; Middlesbrough, 38s. 3½d. cash, and hematite, 48s. 9½d. Copper, easier: Chili bars, G. O. B.'s and G. M. B.'s closed at £43. 17s. 6d. to £44. 2s. 6d. cash, and £44. 5s. to £44. 10s. three months. Tin, easy: Straits closed at £61. 2s. 6d. to £61. 12s. 6d. cash, and £61. 12. 6d. to £62. 2s. 6d. three months. Australian, £61. 17s. 6d.; English ingots, £65. Lead, firm: Spanish, £11. 7s. 6d.; English, £11. 10s. to £11. 12s. 6d.; Silesian spelter, ordinary, £14. 15s. Nickel, 1s. 2½d. Antimony, £30. Quicksilver: first hands, £7. 7s. 6d.; second hands, £7. 3s. 6d. Copper shares, quiet: Cape, 2½ to 2¼; Copiapo, 2 to 2¼; Libiola, 2¼ to 3; Mason and Barry, 2¼ to 3; Rio Tinto, 17½ to 18½; Tharsis, 4½ to 5½.

**GLASGOW, WEDNESDAY.**—Market steady, with fair business. Scotch done at 47s. 3d., 47s. 4d., and 47s. 3d. cash, also at 47s. 5d., 47s. 6d., and 47s. 5½d. one month; closing with buyers at 47s. 2½d. cash, sellers ask 47s. 3½d. Cleveland done at 38s. 5d. cash; closing with buyers at 38s. 3½d. cash, sellers ask 38s. 4½d. Cumberland hematite done at 48s. 11d. and 48s. 10½d. cash, also at 49s. 1d., 49s. 2d., and 49s. 1d. one month; closing with buyers at 48s. 9½d. cash, sellers ask 48s. 10½d. Middlesbrough hematite closes with buyers at 46s. 1½d. cash, sellers ask 46s. 3d.

## REPORT ON MANURE MATERIAL.

There has been more inquiry, but buyers do not seem to be in any hurry, and prices do not show any improvement. Quotations for mineral phosphates are unchanged, and there is not much doing in the higher grades, but there have been sales of South Carolina for summer shipment at something under 5½d. per unit. There has been sales of cargoes of River Plate bones, near at hand, at about £3. 15s. per ton, and £3. 15s. is nearest value of any cargoes afloat. Crushed Kurraachee bones may be had at £3. 18s. 9d. per ton on spot, and at £4. for shipment. On spot, Bombay bone meal offers at £3. 17s. 6d. to £4. per ton, according to quality, and fair average quality, for shipment, at £3. 15s. per ton. The market for nitrate of soda is firm in all positions, though the combination of producers has not yet been finally arranged. Due cargoes are worth 7s. 9d. to 7s. 10½d. per cwt., according to size, ordinary quality. On spot, the quotations are 7s. 9d. for ordinary, and 7s. 10½d. for fine quality. A cargo of Liebig's guano has changed hands, but price does not transpire.

## MISCELLANEOUS CHEMICAL MARKET.

In the alkali trade business continues fairly brisk in all the leading lines. Bleaching powder is still in active demand for export, and price is unaltered at £7., f.o.r. makers' works, and £7. 5s. per ton, hardwoods f.o.b. Liverpool; for continental markets, £6. 15s. f.o.b. Caustic soda continues to have rather an upward tendency, with a good inquiry on the spot, and to-day's prices may be taken as follows:—F.o.b. Liverpool, 77%, £9. 10s.; 74%, £8. 12s. 6d.; 70%, £7. 12s. 6d.; 60%, £6. 12s. 6d. nett, per ton, 10-ton lots and upwards. Alkali, 58%, without change, at £3. 7s. 6d., bags, makers' works. Soda crystals, 37s. 6d., bags. Bicarbonate of soda, in bags, £6., f.o.r. Chlorate of potash advanced to 4½d. Chlorate of soda, 6½d. per lb. Sulphate of copper remains very active, and price has advanced to £16. 10s., f.o.b. Brown acetate of lime is still offering, to realise, at £4. 15s., c.i.f.; grey, nominal, at £7. 10s. to £7. 15s., c.i.f. For muriate of ammonia the demand is, generally, good, and price firm. Other ammonia salts unchanged. Yellow prussiate of potash, 7¾d., with a slightly weaker tendency. Lead salts firm. Potash, caustic and carbonate, are without any change in position or value. White powdered arsenic still selling at high rates, owing to scarcity, nearest spot value being £16. 15s. to £17., f.o.r. Garston. Sulphocyanides in fairly good request, and prices unaltered.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

**OILS.**—There has been more doing in palm oil. Lagos has been selling at £20. 2s. 6d. ex quay, and £20. 7s. 6d. transit. Cargo ex quay has been done at £18. 15s. Olive is firm, business is more active, and prices are inclined to advance. Though linseed is dull, the price for Liverpool makes in export casks remains 20s. 9d. to 21s. per cwt. There is no alteration in cottonseed, Liverpool refined

being quoted 17s. 6d. to 17s. 9d. per cwt. Castor is steady, there being a fairly good demand for good seconds Calcutta at 23½d. ex quay, and 2½d. store. Sales of first pressure French ex store are reported at 23½d. per lb. Tallow is in moderate demand, without any variation in prices. Resin is steady, the lower grades being in good demand at full prices, but the finer qualities are rather neglected. Spirits of turpentine are firm, with a fair trade doing at 21s. 6d. per cwt. Petroleum dull, values being 6¼d. to 7¾d. for American, and 6¼d. per gallon for Russian refined.

### LIVERPOOL MINERAL MARKET.

Our market this week has ruled steady, some minerals showing an advance. Manganese arrivals have improved, but as they have gone direct into consumption, prices are somewhat stiffened; spot stocks are small. Ground manganese is unaltered at £6., £8., £10., and £12. 10s per ton, according to quality. Manganiferous iron ore is quiet at 16s. to 17s. 6d. per ton, c.i.f. Chrome ore: Arrivals are coming in steadily, but the demand is good and prices are well maintained. Bauxite: Inquiries continue to increase, and prices are firm at 20s. per ton for first, 16s. per ton for second, and 12s. per ton for third quality, f.o.b., in cargoes. French chalk: Arrivals have improved, but they scarcely keep pace with the demand, and prices are therefore strong, with an upward tendency: "Angel White" brands at 70s. 9d. to 75s., 80s. to 90s., and 100s. to 110s. per ton, according to grade. Wolfram and scheelite: Spot stocks are scarce, and the inquiry is good, so that prices have somewhat advanced, and have an upward tendency. Arsenic is scarce at £17. to £19. per ton. Fuller's earth: The demand continues steady, the prices for "Emerald" and other brands being unaltered at 50s. for lump, 55s. for ground, and 75s. for impalpable powder. Rottenstone: Prime lump is scarce with a good inquiry, and full prices are being paid: £8. 10s. to £15. per ton, according to quality. Ochres and umbers are moving steadily at somewhat higher prices; J.C. ochre being done at 65s. per ton, and prime umber at 40s. per ton. Carbonate and sulphate of barytes remain unaltered; the demand is quiet, and prices for carbonate are 60s., 70s., 80s., and 100s. per ton, according to quality; prime selected crystal being done at higher prices, as the quantity is but small. Plumbago: For founders' and lubricating purposes the demand continues good, sales being made at £6. to £10. per ton; Ceylon qualities are in good demand at £15. to £20. per ton, according to grade. Pumice stone: The demand is steady, ground being done at £6. to £7. per ton, and superior Teneriffe lump stone at £7. 10s. per ton. Bog ore is in more request at 22s. 6d. to 25s. per ton, according to quality. Magnesite: Raw lump and ground are steady at somewhat higher prices. Lead ore: Potters' qualities meet with a good demand at somewhat higher prices.

### WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

The general market is perceptibly livelier, and with promise of more life as the year opens out. Inquiries after oversea shipments for the new season have commenced, and home orders, though not to say abundant, are in fairly respectable bulk. At the same time stocks do not grow at any inconvenient rate, and prices are for the most part very steady, with no weakening in any case. Sulphate of copper has advanced in price. The position of sulphate of ammonia is still unsatisfactory, with procurable prices at far too low an ebb; but there has been some slight amendment during the week, and Leith prompt quotation may now be stated at £8. 7s. 6d. to £8. 10s. Distinctly superior sorts are held for the latter. Nitrate of soda also is slightly dearer. In the mineral oil and paraffin section the only change is a further drop of 2d. per dozen pounds in candles (paraffin). The raw materials (scale and wax) stand nominally at the reduction of 1½d., as stated below, but makers are taking less, though the exact figures are not allowed to transpire.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. 10s. nett, Glasgow; caustic soda, white, 70° £9. 5s., 70/72° £7. 10s., 60/62° £6. 10s., and cream 60/62° £6. 10s., all nett, Liverpool; bleaching powder, £6. 15s. to £7. 5s. nett, Tyne; saltcake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4¼d. less 5%, Liverpool; nitrate of soda, 7s. 9d. to 8s.; sulphate of ammonia, £8. 7s. 6d. to £8. 10s. prompt, f.o.b. Leith; sal ammoniac, first and second white, £39. and £37. nett, any port;

sulphate of copper, £15. 15s. to £16., less 5%, Liverpool; paraffin scale, hard, 1¾d., and soft, 1½d. to 1½d. per lb.; paraffin wax, 120° semi-refined, 2¾d. to 2½d.; paraffin spirit (naphtha), 7½d. to 8d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6¾d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were 12,090 bags cane unrefined; 7,864 baskets cane unrefined; 12,115 bags beet unrefined; 10,400 bags beet refined.

### TYNE CHEMICAL REPORT.

TUESDAY.

There is a shade more business doing, and shipments, owing to the open season, continue to be made in fair volume. Caustic, 76/77°, £9. 5s. per ton; 70°, £7. 10s. to £7. 15s. per ton. Soda crystals, £2. 2s. 6d. per ton, gross weight. Sulphur scarce at £3. 17s. 6d. per ton. Other products unchanged—

Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett; caustic soda, 76/77°, £9. 5s. per ton, nett; do., 70°, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

SALT.—South Durham salt is steady: 9s. 6d. per ton, f.o.b. Tees, for common.

COALS.—There is practically no alteration in this market. Gas coals continue in good demand. Coke is also in fuller consumption. To-day's prices are:—Best Northumbrian steam, 7s. 9d. to 8s. per ton; second qualities, 6s. 9d. to 7s. per ton; small steam, 3s. 7½d. to 4s. per ton; bunker coals, 6s. 3d. to 6s. 6d. per ton; gas coals, 7s. to 7s. 6d. per ton; household coals, 10s. to 10s. 6d. per ton; coke, firm, 14s. to 15s. per ton.

### HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

OILS.—Prices are a little easier for seed oils, with the exception of rape oils, which continue scarce. The imports into Hull up to date (compared with the same time a year ago) have been:—Linseed, 60,413 quarters against 25,835 quarters. Rapeseed, 3,973 quarters, against 18,215 quarters. Cottonseed, 25,717 tons, against 35,918 tons. Olive oil, 1,001 casks, against 1,376 casks. Rape oil, 535 casks, against 1,177 casks. Oil cakes, 2,841 tons, against 2,057 tons. Tallow, 4,044 cwt., against 2,106 cwt. Bones, 572 tons, against 750 tons. Turpentine, 4,167 barrels, against 2,967 barrels. Linseed oil rather easier, closing quiet at 19s. 1½d. naked spot. February-April offer at 19s. and May-August at 18s. 10½d.; September-December, 18s. 7½d.; boiled and refined from £1. to £2. per ton extra. Export for the week, 640 cwt. Refined cotton oil has declined about 10s. per ton, closing quiet at 15s. 1½d. naked spot; February-April, 15s. 6d.; and May-August, 16s. 3d. Casks, £1., and ordinary barrels 30s. per ton extra. Export for the week, 3,940 cwt. Olive oil very depressed in value, and can be bought at £29. per tun. Turpentine unchanged. Castor oil, 2½d. per lb. for first pressure. Cod oil from £16. 10s. to £19. per ton. Neutral liquid soap, £16. per ton. Mineral oils have experienced a further advance of 10s. per ton, and an additional advance of 7s. 6d. may be expected almost immediately, judging from supply and demand. Locomotive grease, £12. per ton.

CAKES.—Linseed cakes in moderate demand; prices steady: 95% pure, £6. 5s. to £6. 7s. 6d. Oil cakes, £5. 5s.; Russians, £5. 17s. 6d. to £6. 2s. 6d. per ton. Cotton cakes remain quiet: best makes, £3. 11s. 3d.; seconds, £3. 6s. 8d. to £3. 10s. Rapeseed cakes: Black Sea, £2. 6s. 3d.; East India, £3. 6s. 3d. per ton.

PAINTS.—The trade is active, and prices unchanged. Dry mineral colours from £3. 10s. to £8. per ton. Ultramarines, 3lb. to 8d. per lb. White and red leads unchanged. SUBSCRIBERS ARE REQUESTED TO NOTE THAT THE

EX and TITLE PAGE for VOL. XVII.

WILL BE ISSUED WITH NO. 457, FEBRUARY 22, 1896.

## Notices.

communications for the *Chemical Trade Journal* should be  
ed, and Cheques and Post Office Orders made payable to—

AVIS BROS., 32, Blackfriars Street, MANCHESTER.

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

ers will oblige by making their remittances for subscriptions by  
or Post Office Order, crossed and payable to "Davis Bros."

les, reports, and correspondence on all matters of interest to  
emical and allied industries, home and foreign, are solicited.  
ondents should condense their matter as much as possible,  
n one side only of the paper, and in all cases give their names  
dresses, not necessarily for publication. Sketches should be  
separate sheets.

## Advertisements.

Advertisements of Situations Vacant, Premises on Sale or To be Le  
neous Wants, and Specific Articles for Sale by Private Contract are  
in the *Chemical Trade Journal* at the following rates:—

30 Words and under..... 2s. 6d. per insertion  
Each additional 10 words..... 6s. 6d.

Advertisements of Situations Wanted are inserted at one-half the  
rates when prepaid, viz:—

30 Words and under..... 1s. 6d. per insertion.  
Each additional 10 words..... 6s. 3d. "

Advertisements, Announcements in the Directory Columns, and all Adver  
s not prepaid, are charged at the Tariff rates, which will be forwarded on  
on.

Advertisements intended for insertion in the current week's issue  
reach the office by Thursday morning at the latest.

## THE INLAND SEA-WATER SCHEME.

THERE is, we understand, a Bill of considerable interest  
that is to come before Parliament during the session  
that has opened this week, dealing with a proposal to supply  
the Metropolis with sea water for all general purposes, except  
drinking and cooking.

The idea at first sight appears very promising, especially  
from a sanitary point of view, but the subject has its "cons"  
as well as its "pros." It must be admitted that the majority  
of the evidence is favourable to the scheme, for the use of  
sea water has been in vogue in several towns, most of which  
report satisfactorily. Hastings seems to be the only excep-  
tion in this country, while we learn that the idea has been  
tried and abandoned in New York.

At Hastings the principle advantages are not questioned,  
the chief complaint being that the macadam roads are injured  
when watered with sea water, but there are other attendant  
circumstances that would appear to have something to do  
with this expression of opinion, as the Corporation have  
recently had some large surface water reservoirs that they are  
obliged to make use of, left on their hands.

The sanitary advantages to a city like London would be  
great. The facilities for sea baths in every house afford a  
tempting prospect. There are, however, other uses that  
suggest themselves, such as sewer flushing and street water-  
ing, and the saving in fresh water might, we think, enable  
greater care to be given to the drinking supply.

For flushing sewers we are inclined to think sea water has  
many advantages over ordinary fresh water. It is also well  
known that a proposal has been made to electrolyse sea  
water so as to form hypochlorites for the treatment of  
sewage. Though there are many doubts as to whether such  
a process is feasible for the entire treatment of sewage, it is  
safe to say that, with the constant growth of electrical power  
stations, it might not be altogether impracticable to contem-  
plate the periodical use of electrolysed sea water for flushing  
sewers, particularly in the summer time.

For street watering there seems to be a general consensus  
of opinion that it is greatly to be preferred to ordinary water,  
as it more effectually lays the dust and does not evaporate so  
quickly. This is only in accord with past experience, it being  
an acknowledged fact that calcium chloride and other salts  
have been tried with a view to rendering the watering of  
streets more lasting. Expense has been the chief drawback,  
and this does not appear to be such an important factor with  
sea-water, the estimated cost of the whole scheme, including  
the acquisition of the necessary lands for the distribution of  
the water throughout London, being only £450,000.

Exception has been taken it appears at Brighton to the use  
of sea water for this latter purpose, but both this town and  
Hastings, is known to be the seaside resort of the fastidious,

and their complaints do not weigh greatly against the favourable testimony of such places as Tynemouth, Barrow-in-Furness, Weymouth, Bournemouth, Blackpool and Torquay.

Thus the scheme from the sanitarian's point of view is most commendable, but there is little doubt that it will not be so welcome to the water companies.

There are, moreover, many other considerations to be taken into account. It is not easy to say off-hand how the change would affect manufacturing interests. Doubtless where the water supply is obtained from the water companies the old conditions might be left undisturbed, but the probable effects require careful looking into.

Another debatable point has been raised in the query as to whether sea-water would be all that is desirable for extinguishing fires. From one point of view a saline solution is greatly preferable to ordinary water as an extinguisher of fire, but it is likely to cause more damage to household effects and trade stock than fresh water. In the absence of special evidence to the contrary, we should be inclined to think the balance of the advantages would be on the side of salt water, as the damage done by water in the case of fire is generally irrevocable, and, if so, the water that will most speedily extinguish is the most desirable.

These are a few of the points that strike us in connection with this proposal, and they are not without interest to the trade, who will do well to follow the proceedings on this Bill when it comes before Parliament.

## MANCHESTER CORPORATION AND THEIR GAS RESIDUALS.

(Concluded from page 103.)

MR. THOMAS NEWBIGGING, civil engineer, and past president of the Gas Institute, also gave evidence favourable to the proposal of the Corporation. He had for many years, he said, advocated the policy of gas authorities manufacturing their residual products, and particularly of their converting the ammoniacal liquor into sulphate of ammonia, with the view of increasing the profits of the undertakings, and so reducing the price of gas. The lower the price of gas the more it would be used for cooking and heating purposes, and in this way a long stride would be taken in the direction of the abatement of the frequent recurrence of fogs which were so detrimental to health and life in our large towns. The process of manufacture of sulphate of ammonia was very simple and very profitable. It was a process that could be carried on without injury to health. He estimated that the profit from the manufacture of sulphate of ammonia at the Manchester Gasworks would be £4,183. per annum. Judging from the opposition that was being offered to the proposal, he would say that the manufacture was a very profitable one. He saw no reason why the Manchester Corporation should be debarred from engaging in a process which some three hundred gas authorities in the United Kingdom were at present engaged in.

Cross-examined: He would be surprised to learn that last year Messrs. Hardman and Holden, the present contractors for the ammoniacal liquor, made a large loss on this business. He would be surprised to learn that taking one year with another they had been content with a profit of 3 per cent.

Mr. Alderman Lloyd Higginbottom, deputy chairman of the Gas Committee, stated that up till last year, when the Committee advertised for tenders for ammoniacal liquor, several tenders were received, but last year only one firm tendered for the liquor produced at the two principal stations. The Committee felt that they were in one firm's hands, and that they were therefore in an awkward position. The tenders were all for one, two, and three years, but the Committee decided to accept the tender for only one year, in order that they might themselves make arrangements for working up the ammoniacal liquor. The City Council approved of the action of the Committee. As a member of the special sub-committee of the Gas Committee which had been deputed to inquire into the matter, he had visited Leicester, Beckton, and other places where sulphate plants were at work, and he had no doubt that in Manchester a plant could be worked at a profit.

Evidence against there being any nuisance was given by Dr. Bailey and Mr. C. Estcourt.

Mr. Charles Nickson, superintendent of the gas department of the Manchester Corporation, submitted statistics bearing on the question.

Messrs. Hardman and Holden, he said, had for the last fifteen or twenty years taken the liquor, the tar, the spent oxide, and a small portion of the coke produced at the works. In fifteen and a half years the firm's transactions with the Corporation had come to £682,000., or an average of about £44,000. a year.

Mr. Sutton, in opening the case for the opponents of the proposal, pointed out that there was absolutely no evidence to show that the Corporation was in an advantageous position to work up its tar. And as to the sulphate plant, he would call Colonel Sadler and other competent witnesses to prove that the figures which had been submitted were absurdly and absolutely wrong. In any case the evidence had been entirely unsatisfactory, and such powers as were asked ought not to be granted unless it could be shown that the public advantage would counterbalance the inconvenience and destruction of capital that would be occasioned to ratepayers engaged in the trade. Messrs. Hardman and Holden, as he would prove, had a far better chance than the Corporation of dealing successfully with this business.

Colonel Sadler, managing director of Sadler and Co., Limited, Middlesbrough, said he had had 30 years' experience as a chemist in connection with the distillation of tar and ammoniacal liquor. His experience told him that sulphuric acid and sulphate of ammonia plant such as it was proposed to provide would cost at least £33,000., instead of the £20,000. or £25,000. estimated by the Corporation. He considered that the wages and other items in the cost of sulphuric acid had been very much understated. Its cost per ton of sulphate would be at the very least 25s. 2d., instead of 14s. 3d. as stated by Mr. Stevenson; and the total cost of producing and selling sulphate per ton he made out to be £4. 10s. 1d., exclusive of the liquor employed. In the light of his figures he estimated that the proposed manufacture of sulphate by the Manchester Corporation would result in a loss equal to 25s. 7d. per ton of sulphate, or a total loss of £5,116. per annum. Mr. Stevenson had estimated that he would sell his sulphate at £9. per ton, but it was a very considerable time since that price was obtainable.

Mr. Sutton here asked if the Corporation intended to go forward with their application for powers to distil tar. Mr. Hudson said the Corporation did not intend to distil tar at present, but they sought the same general powers as other municipalities. Mr. Sutton objected to such general powers being given merely because other towns had got them, and asked for the inspector's direction on the point.

The Inspector said Mr. Sutton had better make his case against the Corporation's proposal as strong as he could, seeing that general powers were sought.

Colonel Sadler was then examined with regard to the difficulties and complexities of the trade in tar. He said that the tar, at one time cast out as valueless, now yielded some sixty or more products, many of them of great value, and the distillation of these products was very difficult and very risky.—Cross-examined: He did not suggest that in proper hands tar manufacture was not a profitable business. But the business was full of risks, and under no circumstances could he recommend a corporate body to go into it. He admitted that if a Corporation had power to distil the tar and was thus in a position to hold a rod in *terrorem* over the heads of the tar distillers better prices might possibly be obtained than by Corporations that had no such power. Apart from a specialty which they had and which enabled them to get more than merely the sulphate out of the ammoniacal liquor, he feared that Hardman and Holden were at present making a loss on sulphate manufacture; and he supposed the reason they were now opposing the Corporation's proposal was because they were hoping for better times. He knew the sulphuric acid plant had come down in price during the past 15 years, but he still believed that a plant such as was required would cost £20,000.

Mr. Holden, chairman of the directors of Hardman, Holden, and Co., chemical manufacturers, Miles Platting, submitted figures with a view of showing that the Corporation witnesses had very much underestimated the cost of making the sulphuric acid and the sulphate of ammonia. He also gave figures to show that Manchester had been receiving more from the sale of its ammoniacal liquor than the other towns mentioned derived from working up their liquor. In consequence of the fluctuations of the market his company last year lost £3,092. 19s. 5d. on the manufacture of sulphate. During the whole time he had been engaged in that manufacture his profits had only come to 3 to 3½ per cent. on the turnover of sulphate. His Company had given an exceedingly good price for the tar during the years it had obtained it—generally from 3s. to 4s. per ton more than the price quoted in the open market. The reason the Company did not get the tar contract last year was because somebody else made a higher offer. His Company's offer would have been larger but for the fear that the quality would not be up to the mark. In the previous year the quality was low, and although the Corporation made some allowance for that, they distinctly stated that they recognised no legal liability. And he thought that, in the event of coal reaching a high price, there might be a recurrence of such trouble. His Company some years ago erected an alizarine plant at a cost of between £30,000. and

£35,000. For two years the alizarine business was profitable, but now it was not so, and for seven years the plant had been practically idle and valueless. In like manner the chemical trade underwent vicissitudes as to other processes. The discoveries were so frequent that they never knew what would happen from one year's end to another. The Company had one chemist who was engaged in research work alone.—In cross-examination, Mr. Holden admitted that in estimating the cost of the sulphate he had included "salaries," which item, as to three-eighths of it, was made up of the salaries of the managing director and directors. That would have to be deducted from the estimate, in view of the fact that the members of the Corporation, who were in a position corresponding to that of the directors, were not paid for their work. He denied that the market price of sulphuric acid was 23s. 6d. per ton, as stated in a technical journal, or 1s. 6d. per ton less than he gave as the cost of manufacture. The trade journals were often wrong as to prices. Mr. John Craven, of Hardman and Holden's, gave evidence corroborative of that of Mr. Holden.—This concluded the evidence, and the Commissioner was then addressed by Mr. Sutton on behalf of the opponents of the application, and by Mr. Hudson for the Corporation.—At the close of the inquiry Colonel Ducat visited the site of the proposed sulphate works.

### CHEMICAL INDUSTRY IN ALICANTE.

CONSIDERING the size and commercial importance of the province of Alicante, the chemical industries occupy a prominent position.

One of the most important is that of soap-making. Of the twenty-nine works that exist there are twenty-seven at work. These are chiefly situated round the towns of Alicante, San Vicente, Alcoy, Villena, Monovar, Novelda, Elche, Crevillente, and Callera. The combined yearly production of these twenty-seven works is twelve-and-a-half million pounds of soap.

The next most important industry is the extraction of oils. This process is carried out in two ways, viz., by extraction with a chemical solvent and by expression pure and simple in hydraulic presses. There are twenty-seven works in operation in connection with the latter method, the chief of which are situated at Biar, Villena, Alcoy, Muro, Elche, Elda, Novelda, Monovar, Villajoyosa, and Ces. These seed-crushing mills employ 200 workmen. The chemical extraction with carbon bisulphide is carried on to a much more limited extent. There is only one works in operation, and that is situated at Alicante. The amount of oil extracted every year is about 500 tons.

There is another branch of the oil trade represented in Alicante in the shape of two petroleum refineries. Their combined annual production is very considerable, being estimated to be worth £14,000. The number of workmen employed is 120. The wages vary from 1s. 3d. to 4s. 2d. per day.

### THE GERMAN CEMENT INDUSTRY.

THERE are some 63 cement works in the whole of Germany. The Rhine is the principal centre for this manufacture, but in the neighbourhood of Hamburg there are three or four in operation for the production of the article. The annual production of Germany amounts to nearly 11,000,000 barrels, giving employment to some 1,800 hands, whose annual earnings amount to some £698,780. The largest customers for this article in Europe are Russia and Norway, and of Transatlantic countries, the United States, Brazil, Chili, and Venezuela. The exportation to Great Britain and British possessions is comparatively small. The following table gives approximately the quantity and value exported to European and other countries:—

| Country.            | Cwts.     | £       |
|---------------------|-----------|---------|
| Norway .....        | 58,500    | 6,700   |
| Russia .....        | 34,353    | 2,900   |
| United States ..... | 1,386,872 | 168,000 |
| Brazil .....        | 446,340   | 40,200  |
| Chili .....         | 131,000   | 13,000  |
| Venezuela .....     | 103,000   | 9,800   |

### FLOW OF PETROLEUM IN LAMPS.

HERR A. J. STEPANOW has been investigating the working of petroleum in a lamp. He finds that the flow of the oil in the wick does not depend on the specific gravity of the oil, but on the square of the capillarity-constant directly; and on the viscosity of the oil inversely. The capillarity-constant is much the same for different oils, and is very nearly proportional, for oils from the same source, to

the specific gravity. The viscosities of different oils are, on the other hand, very different; they increase with the specific gravity of oils from the same source, and diminish with increased temperature. A heavier Baku oil, can, therefore, be used in a lamp than the corresponding American oil, for the Baku oil is less viscous than the American. A tight wick is better than a loose one, for in the former the top of the wick is better filled with oil when the wick is raised, and there is then less charring. For heavy oils the heating of the burners is of great importance, and if the flow of oil be obstructed this also falls off, so that the illuminating power falls off still more rapidly. The supply of air should always be kept down to a minimum; in solar-oil lamps it is excessive, and this accounts for the excessive consumption in these. With proper construction of the burners the consumption of petroleum oil per amyl-acetate unit is 32.4 grains per hour; of red pyronaphtha 37.5 grains. The better return from 10-line than from 14-line wicks is explained by the air supply increasing in the latter case more rapidly than the oil flow. The heavier the oil, or rather the more viscous it is, the narrower the chimney should be, so as to limit the air supply.

**SALT FOR WILMINGTON.**—The barque *Nor*, 498 tons register, which recently discharged a cargo of resin at Manchester, has been fixed from Weston Point to Wilmington with salt. The *Nor* left Manchester on Wednesday for Weston in charge of a tug.

**DEODORIZING GAS ENGINE EXHAUSTS.**—A useful device for this purpose consists of a box, divided into two compartments by a perforated partition, on which bone black is spread in a moderately thick layer. The exhaust gases from the engine enter into the lower compartment at the extreme left, pass through the perforated dividing wall and superimposed layer of absorbent in the upper compartment, and thence escape into the open air through a pipe at the upper right-hand side. Thus the ammonia and fetid hydrocarbon gases are absorbed by the bone black, and whatever liquid offensive particles may be in the products of combustion are retained by it mechanically. Water of condensation collecting in the lower compartment may be drained off through a drip pipe.

**LIVERPOOL SALT SHIPMENTS.**—During January the shipments of salt from Liverpool totalled 32,900 tons, compared with 32,637 in January, 1895, while from Runcorn and Weston the shipments were 3,736 tons, compared with 5,159 tons, thus showing a total decrease of about 1,200 tons compared with January, 1895. Shipments to the United States have nearly doubled, while increases are shown in the shipments to British North America, West Indies, Africa, Asia, and to European ports, while decreases are noticed to Central and South America and Australasia. The clearances from Liverpool for Calcutta amounted to 9,170 tons, as against 9,116 tons in 1895, and 17,739 in 1894. The probable clearances for February for Calcutta and Rangoon are estimated at 16,100 tons.

**PETROLEUM ACCIDENTS.**—At the St. Pancras Coroner's Court on Saturday Dr. G. Danford Thomas held inquests on the bodies of John Collins (55), sawyer, and Barbara Macmillan (77), a widow, whose deaths from burns were consequent upon the use by them of cheap glass petroleum lamps. In the case of the old lady, widow of a type founder, her death was due to her use of a penny night lamp which she persisted in using in spite of the remonstrances of her family. The foreman of the jury said it was quite time there was legislation to prevent the sale of these notoriously ill-made, fragile, and dangerous lamps, mostly manufactured abroad and imported into this country. Mr. James Gibbons, inspector of the London County Council under the Petroleum Acts, stated that the Council were desirous of legislation to this end, and requiring the marking or stamping of oil lamps by appointed authority as a guarantee that after testing they were found to be reasonably safe. He submitted a metal lamp which was sold at 6d., and was absolutely safe. As showing the necessity of the desired legislation, he mentioned that according to the last available annual statistics, the Metropolitan Fire Brigade were called to 448 fires reported to have been caused by petroleum lamp accidents. Of these 90 were ascribed to explosions and 337 to the upsetting of lamps. There were, in addition, 3,061 small fires resulting from the use of these dangerous lamps, and causing damage—fires of which insurance companies were cognisant, but to which the fire brigade were not summoned. The County Council's inspectors had investigated 284 lamp accidents in the course of one year, 31 of which were fatal, involving the loss of 33 lives. The Coroner said there was the less excuse for the use of these cheap, fragile lamps, mostly "made in Germany" as a home-made safety lamp, constructed on principles approved by the County Council, could be had for 6d. In returning a verdict of accidental death in each case, the jury added a rider in favour of early legislation prohibiting the sale of obviously dangerous oil lamps. It would be interesting to know by whom and on what authority these inspectors are instructed to preach this wonderful doctrine of a 6d. lamp that is "absolutely safe" provided it has been graced with the sanction of the grandmotherly caretakers of the Metropolis.

## SOCIETY OF CHEMICAL INDUSTRY.

## MANCHESTER SECTION.

The fourth meeting of this section was held on Friday, February 7th. Before proceeding to the business of the evening, the Chairman (Mr. G. E. Davis) addressed the meeting upon the recent discovery of Professor Röntgen. He pointed out that Röntgen's demonstration of the correctness of Clerk Maxwell's speculations was only a few weeks old, so that not much was known yet concerning the physical properties of these particular radiations, but several demonstrations had taken place both in this country and abroad, from which something of their nature might be gathered. At the last meeting of the French Academy of Sciences, M. Poincaré exhibited a number of shadowgrams of objects which had been taken through opaque bodies, and M. Lebon made a communication to Professor Arsonval, who laid it before the Academy, tending to show that these X-rays are not merely altered light rays, but radiations accompanying the luminous rays of ordinary light. Though the practical adaptation of the discovery was progressing day by day, it was as well to bear in mind Dr. Speiss's advice that the shadowgrams produced so far were not in the ordinary sense of the word photographs, but rather prints in which the object takes the place of the negative, as in the preparation of transparencies for the lantern. Up to the present there is no known method by which these X-rays can be focussed so as to form an image on a glass plate in the ordinary camera. At Vienna, Professor Neusser has shown his students a print of a gall stone in the liver, and another of stone in the bladder, but the account does not say whether the prints were produced from the living organism, or from post mortem preparations. Professor Mosetig is also credited with having demonstrated with the greatest clearness and precision the injuries caused by a revolver shot in the hand of a patient, and the position and nature of a malformation in the foot of another.

Amongst the shadowgrams exhibited by Dr. Speiss, was one of very interesting character, showing the hand of a servant at the Urania Institution, who some years ago ran a piece of glass into his hand which could not be extracted—the shadowgram, by the X-rays, showed this piece of glass quite distinctly. Recently, at the Camera Club in London, Mr. Campbell Swinton showed some photographs similar to those obtained by Professor Röntgen, by the aid of Crookes' radiant matter tubes. Mr. Swinton employed a half horse-power electric current, and passing it through an induction coil, he loaded ten Leyden jars, the discharge from which was passed through a second induction coil, from the secondary system of which a Crookes' tube was excited. He stated that he only succeeded in this way, and had failed with Crookes' tube excited by an ordinary induction coil. A number of interesting prints were handed round by the Chairman for inspection, and aroused considerable interest among the members.

Dr. Grossman then read his paper on "Recent Developments in the Manufacture of Chlorates." He reviewed the commencement of the industry in this country simultaneously with the discoveries of Pechiney in France, and described his own experiments when at Gamble's works. At that time chlorate of potash was mainly, if not exclusively, being made by the Manchester Aniline Co. with the tartaric acid method, and by Mellor, at Patricroft, by the silicofluoric acid process. He dealt with Colonel Gamble's process for making chlorate of soda, as worked at the Gerard Bridge Works in 1868, and also the plant put down at Hardshaw Brook, in 1879, for the improved process in which sulphate of soda was substituted for carbonate in precipitating the chlorate. At that time the annual consumption was not more than 25 to 50 tons, while to-day it is 500 tons, apart from the chlorate made by other processes. He also referred to the establishment of barium chlorate manufacture in 1881, the process for which had been working unpatented and unknown for fifteen years, and described his experience in the preparation of ammonium chlorate on a large scale. Special attention was drawn by the lecturer to the erroneous statement in most text-books that chlorate of soda liquors could not be safely decomposed with HCl, a thing that had long been done without great risk by running the chlorate liquor into the HCl while steam was passing through it. The paper concluded with a review of the patents referring to chlorates down to the present date.

Mr. Barnes then read his paper on the "Estimation of Organic Matter by means of Chromic Acid," and described his modified process in full. He prefaced his paper by describing a method of obtaining ammonia free water for Nesslerising by means of adding a small quantity of bromine vapour, well shaking and boiling, after which a little KI. is added to remove the slightest trace of Br., and the boiling repeated. There was a very brief and rather featureless discussion, in which Dr. Lewkowitsch and Mr. Grimshaw took part. The discussion on Dr. Grossmann's paper was carried on by Mr. Grimshaw, Mr. P. Hart, and others. The Chairman described the experiences of a London company that started to manufacture chlorate of ammonia on a large scale, with most lamentable results as far as the works were concerned. He also said that explosions had occurred at the Greenbank Alkali Works through running the rough chlorate liquors into HCl. Dr.

Grossmann, replying, said chlorate was first made by Col. Gamble in 1848, when it was impossible to place half a ton a week. The tartaric acid process was re-patented in 1883 to 1884, though it had been known for such a long time. A successful meeting was brought to a close with the usual votes of thanks.

## NOTTINGHAM SECTION.

A most successful meeting of this section of the above society was held on Wednesday, the 5th inst., at the Mechanics' Institution, Derby, amongst the members present being Professor Clowes, Dr. Sudborough, and Messrs. Archbutt, Caven, Kempson, Ward, Wood, &c. Mr. F. Carulla occupied the chair. Mr. L. Archbutt, F.I.C., read three communications. The first was entitled, "Note on the ignition of sawdust by nitric acid," in which the author gave an account of experiments made to find out what danger attaches to the usual way of packing bottles containing this acid in sawdust, when delivered for transit to the railway company. In each experiment the bottle was removed from the box as if for transit, and the cavity left in the sawdust was filled with acid, thus producing the exact conditions of a complete breakage. In one case ignition occurred readily, the mass of sawdust bursting into flames, and in all cases, even with comparatively weak acids, danger was apparent with such varied kind of sawdust as those of pitch pine, white deal, elm, and oak, whether in a dry or a damp state. A discussion followed, in which Mr. Ward, Dr. Clowes, and others took part.—Replying to the chairman, Mr. Archbutt said that he would recommend the use of kieselsuhr, or some similar absorbent material, for the safe packing of bottles containing dangerous acids. The next note, Mr. Archbutt explained, had been prepared in consequence of a suggestion of the president of the society (Mr. Thomas Tyrer), and was a description of some experiments the author had conducted to ascertain the influence at atmospheric temperatures on the pressure of ether and other volatile liquids in closed vessels. An ingenious laboratory arrangement was described, which, being made of glass, permitted one to see what was occurring during the course of the experiments. It appears that what happens in a closed vessel containing ethers, but not quite filled, when the temperature is increased and the pressure rises, is that the residual air becomes dissolved in the ether until the vessel may be completely filled with liquid, the whole of the air being absorbed. This explains why with ethers of 723 s.g., which filled  $\frac{3}{8}$ ths of the containing vessel, the remaining  $\frac{1}{8}$ th being air, a pressure of only 17 lbs. per square inch was obtained on raising the temperature 50°F., viz., from 50° to 100°F.—During the discussion that followed, Dr. Clowes mentioned certain experiments that had been made to show the danger of sending about ammonia cylinders full up to the nipple as has been sometimes done, when warmed, even mild, steel vessels had been shattered by the expansive action of the liquid.—The chairman remarked that the application of safety valves to the vessels would almost appear necessary under such conditions.—Mr. Wood said that in the case of gasoline, which was carried about in wooden casks, these proved a means of relief to the pressure by their porosity. He had tested this by measuring the depth of liquid in a cask and leaving it well closed for some weeks, when he found on again measuring a loss of two inches in the depth.—Mr. Caven thought that neither safety valves nor exudation through the wood were desirable means of protection when dealing with inflammable liquids.—Mr. Wood explained that the mixture of air and gasoline produced a permanent gas. He had collected some in a holder, which was kept cool for a length of time, without the gasoline becoming liquified.—The Chairman here asked whether any of the members had any experience with the ether light used for magic lantern purposes. The light, he believed, was produced by passing oxygen from a cylinder through ether usually of 730 s.g., i.e., the ordinary methylated sort. Recently an explosion occurred when using this light, which he (the chairman) was disposed to attribute to the absence or to defective character of the safety jet that should apparently be used. It had, however, been considered that the high specific gravity of the ether was at the bottom of the mischief, which he was not disposed to agree with.—Dr. Clowes, whose experience with explosive gases entitles his views to respect, considered that the explosion referred to might certainly be due to ether of 730 having been used, and that one of a lower specific gravity would be less likely to produce an explosive mixture.—A further note on Hübl's test completed Mr. Archbutt's varied and interesting contributions, for which, on the motion of Dr. Clowes, he was most heartily thanked, the meeting then terminating.—Mr. John White, F.I.C., has promised to read a paper at the next Derby meeting, which will take place in April.

MESSRS. A. DE RONDE AND CO.—This firm has sent us a neat little desk calendar for 1896, which is specially suited to the requirements of the chemical trade, as on each sheet there is a table comparing specific gravity with the Beaumé and Twaddell hydrometer scales. The table ranges from 0°Tw. to 217.4°Tw., or a sp. gr. of 2.087.

## MANGANESE MINING IN THE VIRGINIAN VALLEY.

[BY JOS. D. WEEKS.]

THE chief sources of the manganese produced in Virginia, U.S.A., have been the mines of the Valley of Virginia, or, as it is sometimes called, the Shenandoah Valley. The manganese belt in this valley lies along the western base of the Blue Ridge, on the eastern side of the valley. It is asserted that this belt extends 300 miles, and that workable beds of manganese ore have been found in every one of the twelve valley counties that abut on the western edge of the Blue Ridge.

It is along this belt that the remarkable body of iron ore accompanying the Potsdam or No. 1 of Rogers is found, and with this iron the manganese ores are associated.

It is impossible in the space of the present report to describe the deposits of manganese ore which have been mined in this valley. They will be found described at some length in the 1885 volume of "Mineral Resources of the United States." A brief description, however, of the Crimora Mine, which is, as has been stated several times, the most important deposit of manganese in the United States, may not be without some interest.

The ore deposit, which is most peculiar in its location and accumulation, occurs in an elliptical basin about 500 feet broad on its transverse axis and 800 to 900 feet long. This basin is cut out of the Potsdam sandstone, which is hard rock at this place. Opposite to the basin and at right angles to its longer axis is a deep ravine, Turks Gap, sharply cut into the flanks of the mountain, through which a stream flows. Nearly opposite to this ravine is a ridge that served as a bulwark to the action of the forces at work in this section. Evidently this basin is the work of old-time eroding agencies, acting just as water now acts below a river dam, excavating a deep-curved section. The formation and location of this basin, as well as the deposits it contains, is exceedingly interesting and peculiar.

The basin is filled with wash and manganese ore lumps. The general body mixture, the mud, sand, and clay, with the lumps of manganese ore, were carried to place by agencies more recent than those which excavated the basin, just as the iron ore pits in the limestone valleys of Pennsylvania were filled in.

There are two, possibly three, special layers of yellow clay, which are rich in lumps and masses of ore, the lower about 30 feet, the upper about 25 feet, in thickness. A layer of clay, 20 feet thick, almost barren of manganese ore, separates these two ore-bearing layers.

The ore is found in lumps and masses from the size of a small pebble to lumps weighing a quarter of a ton or more. One mass was found which was 115 feet by 60 feet and 50 feet high. These lumps are found scattered through the basin, as above indicated, and cover an area of about six acres. The basin at the shaft is 117 feet deep. Some "sheets" of ore formed by the union of masses that lie in a pretty uniform direction are also found. The larger masses are blasted in the mine.

For many years, indeed up to 1892, when the lease of the property expired, the mine was operated by the American Manganese Company, Limited. As the method adopted by this company for sinking shafts and washing the ore was very elaborate, more so than that adopted at any other manganese mine in the United States, a brief description is given of the methods used. It should be noted that previous to sinking the shafts a number of test holes were drilled in various portions of the property to give an idea of the extent and locality of the ore pockets. The shafts were sunk through the clay to below the bottom of the ore and at a distance from it, so that their stability would not be interfered with by the mining operations. The main tunnel was also driven outside of and below the ore for a similar reason.

From the main tunnel chutes run out in all directions to the ore pockets, where treadings are driven out on the level in various directions. The excavation of the ore proceeds at several levels at once in the same pocket by stopping with timber, secondary chutes being provided, into which the material from the various levels is dumped, which finds its way to the main chute, and so to the cars. All of the mining is done by hand. Where the material is hard, hand drills and dynamite are used.

The water in the workings is conveyed in wooden troughs to the chute, where it passes down with the material and partly washes it.

About 300 tons of material were mined in a day of 12 hours, which, after crushing, washing, and separating, leaves about 50 or 60 tons of ore.

The material having no regular formation, but being heavy and loose, necessitates strong timbering of the headings, and the timber is in some places subjected to such a great strain that it has to be renewed about every 30 days. The large quantity needed may be gathered from the fact that about 1,500,000 feet are used in the Crimora mine in a year.

The main tunnel is seven feet square inside measurement, having timbers 12 x 12 inches three feet apart, which are framed to fit into each other, to make a framework, and have planking or slabs 12 x 12 inches at top and sides to resist the outside pressure.

All material as it comes from the mine is dumped into the chute above the crusher and fed through it. It falls directly into the "log" washer, which consists simply of two shafts about 18 inches in diameter and 24 feet long, on which are bolted spiral shaped teeth, running in a box or frame 24 feet long, 5½ feet wide, and three feet deep, filled with water. From this, material in a semi-washed state passes into the Bradford washer, which is a cylinder 13 feet long and 4½ in diameter, with teeth about seven inches long on the inner circumference. From this it goes into the classifying screen (conical shape) with a ¾-inch mesh. All that passes over the screen runs out on the conveyor, and while it is being conveyed into the cars the flint and other refuse matter is picked out. What passes through the ¾-inch mesh in the classifying screen runs by a chute into an elevator, and is then dropped into a jig, where all foreign matter is removed, the refuse passing off at the top, and the cleaned ore at the bottom runs into settling tanks and is raised by another elevator and dropped by chute into cars. All machinery works automatically, and the material is not handled after it is put into the crusher.

An analysis of the best quality of ore from this mine by Mr. A. S. McCreath shows the following:

### Analysis of Manganese Ore from Crimora.

|                         | Per cent. |
|-------------------------|-----------|
| Metallic manganese..... | 57.291    |
| Metallic iron.....      | 3.73      |
| Phosphorus.....         | .075      |

## SHEEP DIP AND GULLABILITY.

A WEST HAM local paper has been investigating the mysteries of making sheep dip, and has collected the following tasty details of the process, the richest bit of all being that the ever susceptible, sensation-loving "Daily Chronicle" has fathered the lot *et tous les embellissements*:-

"The materials used in the manufacture are caustic soda, sulphur, and red and white arsenic. The men wear overalls of brown holland, and before they go near the chemicals their faces have to be enveloped in silk handkerchiefs, leaving only their eyes uncovered. At the end of the day's work you see them coming away with their eyes in a horrible state—literally bunged up with inflammation and impurity. First of all the ingredients have to be stirred about briskly in large open vessels, and the operation produces clouds of steam, which is (sic) so heavily charged with poisonous fumes that the visitor, unused to breathing such stuff, sneezes and splutters at the first whiff of it. The men, however, have to work in it all day long. They themselves say that the last process is by far the worst. . . . The compound has to be ground and passed through a sieve, and it must be as dry as possible before this can be done. When it has gone through the sieve the powder comes down a kind of shoot, and if there is a current of air in the room it blows the fumes and the powder into the men's faces and on to their clothing directly they open the shoot doors. The men are not forced to work fast. Indeed, they are warned not to exert themselves enough to bring on perspiration, for then the powder will hold to the skin and eat into the pores. When the powder gets into the pores it causes violent itching, but woe to the man who scratches his skin! So much do the men dread the effects of the powder upon their faces that they cover themselves with Fuller's earth before they begin their work. . . . About twenty men and boys are engaged on this work at one factory, and only a few of them can keep on at it every day. They are frequently laid up, some for weeks at a stretch. Indeed, the proprietors of the place are continually taking on fresh men to fill the places of the victims. . . . The employers comply with the provisions of the Factory Acts in regard to dangerous occupations. But it is evident that if the manufacture of this sheep dip is so deadly, even after all Home Office precautions are regarded, as to shorten the span of human life to five years, the manufacture ought to be prohibited altogether." It would be a public benefit if such sensation-mongers were similarly treated.

THE WELSH TIN-PLATE TRADE.—In consequence of the continued depression in the tin plate trade, and with the object of maintaining the standard wages rate, a special council of South Wales Tinplaters' Union, which was the largest representative meeting held for nine years, recently took place at Swansea. It was decided to instruct all men working monthly contracts to tender their notices on the first Monday in February with the object of bringing about a general stoppage, beginning on March 1st. This will affect 60 works and nearly 11,000 hands. The meeting adjourned till February 22nd.

## Reports of Companies.

### CASTNER-KELLNER ALKALI CO., LTD.

THE first ordinary general (statutory) meeting of the shareholders of this company was held on Thursday last week, at the Cannon-street Hotel, E.C., Mr. William Mather presiding.

The Secretary (Mr. H. Clarkson) having read the notice convening the meeting, the Chairman said: Gentlemen, you are aware that this is the statutory meeting of the company, which gives the directors an opportunity of becoming acquainted with the shareholders. Since the shares were allotted we have proceeded diligently in preparing for the new industry which we believe is likely to have great influence on the future of the alkali trade. We have been able to secure a very eligible site for the erection of new works near Weston Point on the estuary of the Mersey. The contract for the land has been completed, and I can safely say that so far as the situation is concerned, it affords excellent facilities for carrying out business on a large scale. The building of the works commenced this week, and will be pursued with the utmost diligence during the next few months. I must mention that the public subscription for the shares largely exceeded what we required. We do not stand alone in beginning this electrolytic process. The directors of the Solvay-Werke Gesellschaft, of Germany (people second to none in the world in connection with the chemical trade, having large establishments in America, Russia, Italy, and all over the Continent) have made careful investigations, and are so perfectly satisfied with the Castner-Kellner process that they have not only subscribed largely to the capital of this English company, which in itself is satisfactory to us, but determined to erect works in Germany simultaneously, and on the same lines and magnitude as ours. I may say that the plant has been ordered from this country so as to be precisely the same. (Hear, hear.) The Solvay Co.'s works will be placed at our disposal, and, in return, they have our experience. The Mathieson Alkali Co., of America, have already erected their plant, and the statements made to them regarding the Castner patents have been realised, and the reports from the United States are most favourable, the process giving perfect satisfaction, far beyond anticipation. As a corroboration of this I may add the company has decided to erect works on the Niagara Falls to enable them to extend the business. Our manager has had great experience, and is one of the best experts in the electrolytic and chemical world. I think you will agree with the directors in their belief that this industry is likely to be eminently successful in the future. Works will be established in various parts of the world, and will be conducted on the same lines as our present undertaking, and we shall then have the advantage of experience of previous results, before we proceed to expend the larger portion of our capital. I need not say more than that your directors wish to assure you that they are prepared to devote their time largely to this enterprise. We are none of us speculators, or company promoters, but anxious to make the future of this industry sure of success, and you may rely upon each one of us, according to his experience, giving our best knowledge and time in the interests of the enterprise, in which we are all largely concerned. The quotation for the shares will be made out in the course of a week or two. All preliminaries have been placed before the Stock Exchange and met with approval, so that in a fortnight's time you will be able to see how your shares stand in the estimation of the Stock Exchange. You may rest assured that the affairs of the company are in the hands of men well aware of their responsibility, who will do their utmost to fulfil them with satisfaction. If there are any questions shareholders would like to ask, I shall be happy to answer them to the best of my ability.

Replying to questions, the Chairman said the present market price in Liverpool for caustic soda, of 66 to 77 per cent., was from £7 5s. to £9 15s. per ton. One important factor connected with their product was that it would be of a higher quality than had hitherto been found on the market. Their works were situated very conveniently near two canals, namely: the Manchester Ship Canal and the Weaver Navigation. They had cheap and direct railway communication to Liverpool.

A cordial vote of thanks to the Chairman terminated the proceedings.

### ROSARIO NITRATE COMPANY, LIMITED.

The annual general meeting of this company was held on Thursday, last week, at Winchester House, E.C. Mr. Archibald Balfour presided, and, in moving the adoption of the report, said he thought that the prediction which he made at their last meeting, that the results of the present year's working would be satisfactory, had been verified. They had to deal with a total gross profit of about £116,000., compared with £169,000. last year, but, in making this comparison, it had to be remembered that an alteration had been made in the manner of carrying the stock of nitrate, etc., to the balance-sheet. It had

hitherto been their custom to take these stocks at a valuation, but in the present accounts they had been taken at cost price, and they thus represented a considerable additional profit. Since the date of the balance-sheet the stock of nitrate had been sold, and a considerable quantity besides, at prices which would, he thought, be considered satisfactory. The total make of the company for the year was 1,859,000 quintals, against 1,647,000 quintals in the previous year. The board were able to propose a further dividend of 5 per cent., making 10 per cent. for the year, and, after providing for the debenture sinking fund, a balance of £690. would remain to be carried forward. The burning question of a nitrate combination was occupying a considerable amount of attention at the present time. At their last meeting he stated that negotiations were going on in connection with this subject, and he might state that they had been going on since, and they were not absolutely concluded yet. However, excepting one or two small producers, unanimity had now been arrived at, and the Rosario Company had given its adhesion to the proposal. No doubt, their output would thus be diminished, but it was considered that it would be to their interest to join the combination. Moreover, their output would sell at a better price, so that they would obtain the same profit for a smaller quantity under the combination as they would for a very much larger quantity if the combination had not been formed. This was an important point, for it saved them from encroaching to such a great extent on their caliche-bearing grounds. During the year they were enabled to carry out successfully the operation referred to in their report last year—the placing of a special debenture capital of £200,000. to provide the funds required for the payment of the nitrate grounds known as the Puntilla de Huara and the erection of a new *oficina* thereon. The loan, he might state, was largely over-applied for. The motion was adopted.

*Initiarubber, Guttapercha, and Telegraph Works.*—The accounts show, after provision for doubtful debts, a nett profit for the past year of £49,325. 12s. Adding £20,913. 17s. 4d. brought forward, and deducting £12,500. interim dividend paid in July, there remains a disposable balance of £57,739. 9s. 4d. The directors recommend the distribution of a dividend of 15s. a share, free of income-tax, amounting to £37,500., making, with the interim dividend, a total payment of 10 per cent. for the year, and leaving £20,239. 9s. 4d. to be carried forward.

*Price's Patent Candle Co.*—Subject to audit, the accounts show that the profit for 1895 is about £81,700., to which has to be added £8,842. undivided profit from 1894, making together about £90,500. Deducting the dividend of 15s. per share, amounting to £28,125., paid in September, 1895, a sum of about £62,500. will be available for disposition at the meeting, and the directors recommend that the usual sum of £12,500. be written off for depreciation, that £32,812. be applied in paying a dividend of 17s. 6d. per share, that £10,000. be added to the reserve fund, and that the remainder (about £7,100.) be carried forward.

### DIVIDENDS.

*Messrs. Brunner, Mond, and Co., Ltd.*, announce a dividend of 30 per cent., carrying forward £95,060. This dividend is the same as last year.

*Salt Union, Ltd.*—The directors recommend dividends at the rate of 7 per cent. on the preference shares and 2 per cent. on the ordinary shares for the year ended 31st December, 1895, carrying forward about £11,000.

*Dec Oil Company, Ltd.*, Saltney, have declared a dividend of 6 per cent. per annum on the ordinary shares for the year ended 31st December, 1895.

*Patent Victoria Stone Co.*—In their annual report the directors recommend a total dividend of 10 per cent. for the year, leaving £3 963. undivided.

"PHOENIX" VERMILION.—Messrs. Berger, Kahler, and Co., of 7, Mark-lane, E.C., who are introducing this new vermilion, have sent us a sample of the pigment, and also a circular printed with the same. The tint is pleasing, and certainly stands acids well. There is really a great want for an inexpensive red colour, which in its manifold uses possesses the desirable resistance against chemicals (acids and alkalis), light, atmosphere, and heat, up to about 500 F. The prominent physical and chemical properties of the "Phoenix" vermilion should secure its universal use as an outside and inside paint in connection with oil, varnish, lacquer, lime, silicates, etc., on cement, wood, metal, leather, enamel, porcelain, and in all cases where a red colour of particular brilliancy is required, as, for instance, for all manner of printing, for wallpapers, paper, tinfoil, tinfoil capsules, for red pencil leads, and with astonishing success for sealing wax.

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

- Manufacture of Cyanides. J. J. Holden and H. Baum. 1,900. January 27.  
 Apparatus for Reducing Metals, Producing Acetylene Cyanogen, Nitrides, etc., by Electro-thermal Treatment. H. Maxim. 1,903. January 27.  
 Manufacture of Detergent. S. Woble and A. C. Irwin. 1,978. January 28.  
 Ferrite and Ferrate of Soda. H. R. Angel. 1,980. January 28.  
 Improvements in Manufacture of Nitric Acid. R. J. Friwell and Brooke, Simpson, and Spiller, Ltd. 2,021. January 28.  
 Manufacture of Graphite Blocks. F. Ulrich. 2,027. January 28.  
 Sewage Treatment and Apparatus therefor. J. Hamer. 2,063. Jan. 29.  
 Utilizing Waste Heat for Generating Steam or Drying. J. Horrocks. 2,101. January 29.  
 Electrolysed Chloride Solutions for Disinfecting. E. Hermite, E. J. Paterson, and C. F. Cooper. 2,197. January 30.  
 Treating Wool. J. C. Anderson. 2,213. January 30.  
 Producing Paint. C. Sullivan. 2,219. January 30.  
 Artificial Stone. F. Turner. 2,223. January 30.  
 Extracting Oil from Fish, Refuse, etc. J. Jack. 2,247. January 31.  
 Preparing Magnesium Chloride Solutions. F. T. B. Dupré. 2,271. January 31.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal and ALL RIGHTS of publication are RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in the Production of Oxygen Gas and Apparatus therefor. A. Sweetser, 67, Croxsted-road, West Dulwich. Eng. Pat. 12,245. June 24th, 1895.

The apparatus is specially designed for the continuous generation of oxygen from chlorate of potash, &c., and the storage of the gas in a collapsible holder, the whole being arranged to afford a convenient and portable apparatus for use with oxy-hydrogen lime-light, and for similar purposes. There are three drawings.

Improvements in and Means to be Employed for the Obtainment of Zinc from its Ores, and the Electro-deposition of Zinc upon Iron, or other Metals and Alloys. The Cowper-Coles Galvanising Syd., Ltd., 39, Victoria-street, Westminster, and S. O. Cowper-Coles, 16, Adam-street, Manchester-square, London. Eng. Pat. 2,999. February 11th, 1895.

To obtain a bright adherent deposit of zinc on iron, &c., and avoid the formation of zinc sponge, an electrolyte containing zinc sulphate, and ferrous sulphate is used, the latter being partially oxidised to the ferric state. A good proportion is found to be 35 ounces of zinc sulphate to 12 of iron. It is preferable to keep zinc dust suspended in the electrolyte, so as to neutralise the acid as fast as liberated. The anodes can be made of the zinc ore, oxide of zinc, a basic salt of the same, or of iron. It is sometimes desirable to give the articles to be zincated a coating of oxide, which is done by dipping in a bath of potassium bichromate, and then drying on a sand bath. The electrolytic oxygen, it is claimed, prevents the formation of hydrogen compounds of zinc, so preventing the formation of sponge, while the ferrous sulphate is oxidised to the ferric state at the anode, and again reduced by hydrogen liberated at the cathode.

Treating Galvanisers' Flux Skimmings to recover Ammonia, and facilitate the extraction of the Zinc, with Apparatus for Use therein. C. T. G. Bennett and E. H. Shortman, Pelsall, Staffs., and B. Bracey, Avondale-rd., St. George's, Bristol. Eng. Pat. 5,938. March 21, 1895.

In the usual treatment of the skimmings, the ammonia, as well as being lost, was a source of trouble, since it prevented the whole of the zinc being recovered. By this process the ammonia is removed first by adding excess of lime, which neutralizes the acid and liberates the ammonia. The residue is then dried and treated in the usual way for the recovery of the zinc. In carrying out the former step, the skimmings are boiled in a horizontal wrought-iron boiler, fitted with an agitator. The ammonia escapes into a wide vertical pipe, packed with coke, which retains any traces of lime, &c., that may be carried over by the gas. It next passes through a small tank, and from thence into a condensing coil, from which the solution of ammonia flows away into store tanks. Any gas that condenses in the small tank is run, by a bye-pass, back into the boiler. When desirable, the warm water surrounding the condensing coil can be run down the coke-packed pipe to cleanse it. There is one drawing.

Metallic Mixtures and Alloys for Effecting Electro-Chemical Decompositions. O. Imray, 28, Southampton Buildings, London (communicated by Dr. L. Diehl, Hamburg). Eng. Pat. 2,804. Feb. 8, 1895.

Alloys of aluminium or magnesium with lead, tin, and zinc, are prepared, which, when brought into contact with either hot or cold water, liberate hydrogen. Such alloys may be used for many purposes, but the special object of their preparation is for the separation of gold from cyanide solutions. The alloy for this purpose contains 5% of Al and Pb and 90% zinc for solutions containing 0.1% or more of cyanide. The alloys are best used in the form of turnings or shavings packed in boxes, up through which the cyanide solution is caused to pass.

## COTTONSEED OIL MILLS AT NEW ORLEANS.

A new cottonseed oil mill has recently been opened at New Orleans. The mill belongs to the New Orleans Cottonseed Oil and Manufacturing Company, Ltd., whose capital is £6,000.

It has a grinding capacity of 35 cars of cottonseed a day, and will employ about 35 men. It is under the management of Lawlor and Chaery, who are old-time millmen and brokers in cottonseed products. With the addition of this mill the cottonseed oil mills of New Orleans have a grinding capacity of about 1,000 tons per day. This amounts, with seed at £2 a ton, to £2,000 a day, which is distributed among the farmers of the neighbouring States during the six months of the year that the mills run. When the branch mill of Messrs. Lever Brothers, Ltd. (England), which is being built at Vicksburg, U.S.A., at a cost of £40,000, is completed, New Orleans mills will have a grinding capacity of 1,150 tons a day. When both the new mills are in operation New Orleans will be one of the largest cottonseed oil markets in the country, and five or six hundred men will draw their salaries from cottonseed oil mills. About 100 men are employed for every hundred tons of seed crushed.

When, on January 2nd, the wheels turned for the first time in the new mill of the Oil Manufacturing Company, Ltd., there were 42 carloads of seed standing on the railroad switches, so it can easily be seen that there will be no suffering so far as paucity of material is concerned.

## Trade Notes.

**SERIOUS PETROLEUM FIRE.**—On Thursday last week, a fire broke out at the Peruvian Corporation at Callao, caused by an explosion of petroleum. For six hours the town was in great danger, owing to the risk of the flames spreading to the large petroleum stores alongside the burning building. Sixty tons of coals were consumed, together with two tanks of petroleum and a portion of the general stores. The man through whom the fire originated was killed by the first explosion, and two firemen injured.

**RENEWAL OF THE BATOUM OIL SHIPMENTS.**—The Consul at Batoum reports that through communication between Baku and Batoum, both for passengers and goods, has been resumed on the Trans-Caucasian Railway, and that, although the line is not yet in a thorough state of efficiency, a number of petroleum trains which were on the line at the time of the interruption, have already arrived at Batoum. Two pipe lines of small dimensions have also been laid between the stations of Molita and Biclogon, one by the Union of Baku Petroleum Refiners, and the other by outside firms.

**THE UNITED ALKALI COMPANY'S NEW RULE.**—Owing to the recent accident at Widnes, the United Alkali Co., Ltd., have issued the following rule concerning the cleaning of sewers:—"No person must be allowed to enter any part of a sewer, whether closed or open, unless he is thoroughly secured by a rope around the waist, such rope to be connected securely to the surface of the ground, and two men at least must be in attendance on the surface ready to render assistance in case of need." The Directors request that managers of works will personally see that the rules, and all other conditions which have for their object the prevention of accidents to workmen, are strictly enforced.

**THE SCOTCH OIL TRADE.**—Now that the Scotch oil trade combine is completely dissolved, and cutting is again general, it is feared that not more than two or three Scotch companies will declare a dividend two months hence. Practically, the whole of the large gains promised by the combination have been lost, and as half a million of Scotch capital is invested in these companies the loss to investors will be heavy. Thus the Standard Oil Company of America is once more master of the situation. There is this difference however. The Scotch producers will be once more free to speak the truth about the use of low flash oil. It is a point well worth considering from a business as well as a scientific point of view.

**SAD DEATH OF A CHEMIST.**—The dead body of Mr. Joseph Edgar Law, aged 26, of Brook Cottage, Castleton, a manufacturing chemist, was recovered from the canal basin at Hopwood on Tuesday. How Mr. Law got into the water is not known. He had been missing since Friday, 7th inst., on which day his father, Mr. James Law, left him well and hearty at the Manchester Royal Exchange.

**GERMAN COMPETITION IN THE COAL TRADE.**—It is unpleasant, though not surprising, says the *Financial News*, that Westphalian coal, rather than English coal, has been getting the benefit of the increased demand in Hamburg. Imports of the former were 105,000 tons larger last year, while the imports of English coal into Hamburg only rose 23,000 tons. The Rhenish-Westphalian Coal Syndicate has, however, only obtained its hold of the Hamburg market by means of great sacrifices, and it is quite possible that English coal shippers will regain their former ascendancy.

**RIVAL INCANDESCENT GAS LIGHT COMPANIES.**—Before Mr. Justice Mathew, the case of the Incandescent Gas Light Company v. Helio Incandescent Gas Burner Company and others, came on recently. It was an action in which the plaintiff company sought to recover damages for the infringement of certain patents. They also asked for an injunction restraining the defendant company from further infringement.—Mr. Walters, on behalf of the plaintiffs, said he understood that the defendants consented to judgment for an injunction, damages, and costs.—Mr. Arthur O'Connor, M.P., said he had been instructed to consent to judgment for the plaintiffs.—Judgment was accordingly given for the plaintiffs, with costs.

**GERMAN IRON AND STEEL PRODUCTION.**—According to the statistics collected by the Association of German Iron and Steel Manufacturers, the pig-iron production of the German Empire during the year 1895 amounted to 5,788,798 tons against 5,559,322 tons during 1894. The total output was made up of 1,524,334 tons of puddling pigs and Spiegeleisen, 444,495 tons of Bessemer pigs, 2,898,476 tons of Thomas pigs, and 921,493 tons of foundry pigs. The several divisions of the Empire furnished the following proportions of the whole production:—North-Western group, 47.8 per cent., or 2,765,427 tons; Eastern group, 9.2 per cent., or 531,451 tons; Northern group, 4.6 per cent., or 274,685 tons; and South-Western group, 21.6 per cent., or 1,252,312 tons. Nearly  $\frac{3}{4}$ , or 82.2 per cent., of the output of Bessemer pigs is furnished by the North-Western group.

**SAVANNAH PHOSPHATE SHIPMENTS.**—The following are the shipments of phosphate rock from the port of Savannah, Ga., U.S.A., during the year 1895:—

| Month.         | Tons.  | Month.          | Tons.  |
|----------------|--------|-----------------|--------|
| January .....  | 5,644  | July .....      | 8,509  |
| February ..... | 4,100  | August .....    | 4,658  |
| March .....    | 3,961  | September ..... | 2,275  |
| April .....    | 5,972  | October .....   | 8,550  |
| May .....      | 18,418 | November .....  | 10,556 |
| June .....     | 4,628  | December .....  | 3,156  |
| Total .....    |        |                 | 80,427 |

**THE NEW LIGHT RAYS.**—It is not often that a scientific society in London has to announce "house full," but at Mr. Swinton's demonstration of the Röntgen process before the Royal Photographic Society this week crowds were turned away. The lecturer began by illustrating the effect of the ordinary electric discharge upon a sensitive plate. From that he passed to the vacuum or Geissler tube, which he exhausted while the current was illuminating it, and showed in conclusion a brilliant collection of Crookes' tubes phosphorescing with rays of all colours, according to the nature of their contents. Amongst the most beautiful were a group of rubies, which the cathode rays caused to glow with a deep red light. Photographs were shown in the lantern of the bones of the hand, of a foot, of a live frog, and of a sole, and a number of the audience handed up their purses to the platform in order that their contents might be photographed without the purses being opened. A visitor with a splintered bone in the middle finger of his left hand also submitted to the operation, which resulted most successfully, the bones of the entire hand being very clearly rendered. The Earl of Crawford, Mr. J. W. Gifford, and Captain Abney, among others, discussed the results, and commented very warmly on the success of the demonstration. A series of experiments now proceeding in the studio of a well-known London photographer has shown, however, that similar, or at least analogous, effects can be got by placing the photographic slide under an ordinary incandescent electric lamp, having first taken care to break the filament. The improvised "Crookes's tube" thus produced has, of course, a comparatively poor vacuum and a comparatively weak electric power. But if coins or metal buttons or bones, even stout pieces of cartilage, are laid on the top of the wooden shutter which conceals the plate and left for an hour or more an excellent picture of the objects can be developed.

**FISH IN THE MEDLOCK.**—Mr. Z. Walsh, writing to the *City News*, says:—In the year 1838 I was prevailed upon to strip and pass a net line or cord under some brushwood on the bank of the Medlock at Clayton Bridge, opposite the residence of the late Sebastian Nash. The draw was a good one of fine, clean trout. Higher up the stream, in a pool below the weir, could be seen any bright day scores of young trout, and this was so up to the year 1840, when I left that district.

**SALICYLIC ACID IN BRITISH WINES PERMISSIBLE.**—An important case connected with this point was heard at the Westminster Police Court recently. The wine sold admittedly contained 38 per cent. of the acid, or equivalent to 26.6 grains per gallon. The public analyst, Mr. Cassall, and Dr. W. H. Corfield deposed that the acid, even in the quantity used, was injurious to health. For the defence a large number of expert witnesses were called who regarded salicylic acid as a most useful preservative, and as being, in the quantity employed, perfectly harmless. Mr. De Ruten, in the course of a long judgment, said he had no hesitation in dismissing the summons on the ground that the drug was not, in the quantity used, injurious to health, and had not been added to the wine to increase its bulk or conceal its inferior quality, but solely for antiseptic purposes. Mr. A. Gill (who appeared for the vestry) said they could not appeal, because his Worship had decided on the question of fact.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are fairly steady, 90's are quoted 2s. 1d. spot and 2s. forward, 50/90's 1s. 8d. to 1s. 8½d. Carbolic acids are firm, prices having advanced: Crude, 60%, is now standing at 2s. 1d., and 40% crystals 8d. Naphthas are unaltered, both as to position and price. Anthracene and creosote quiet. Pitch easy at 35s. 6d. to 36s., f.o.b., East Coast.

Sulphate of ammonia is much firmer. There has been a fairly good demand in spite of the advancing market, though orders from consumers have not been much in evidence. Closing values are:—Beckton £8. 12s. 6d., London outside makes £8. 10s., Liverpool £8. 10s., Hull £8. 10s., and Leith £8. 10s. to £8. 12s. 6d., all prompt. Nitrate steadier.

### LIVERPOOL MINERAL MARKET.

The firm tone reported last week has been more than maintained in minerals generally, and in some particular cases stocks have been entirely exhausted. Manganese arrivals continue very slow, whilst the demand is considerably increased; spot stocks are practically *nil*, and prices have advanced. Ground manganese continues in good demand at £6., £8., £10., and £12. 10s. per ton, according to quality, but there is an upward tendency. Sulphate of manganese sells freely at £18. to £19. per ton. Manganiferous ore: There is a better demand for this article, and the price is unaltered. Chrome ore: Arrivals continue to come in slowly, but importers are securing their prices. Bauxite: The inquiry is strong, and prices are firm and likely to go further now that the largest undertaking for the manufacture of aluminium is about to commence, and therefore large quantities of bauxite will be consumed. French chalk: Although the arrivals have increased, still the demand is such that not only have they been consumed, but stocks are practically reduced to *nil*, and prices continue firm at 70s. to 75s., 80s. to 90s., and 100s. to 110s. per ton. Wolfram and scheelite: Spot stocks continue scarce, especially of high quality, and prices have advanced, and are likely to do so in the future, as prices have been below the cost of production. Arsenic continues scarce at £17. to £19. per ton. Fuller's earth is in good demand at unaltered prices—50s. for lump, "Emerald" and other brands, 55s. for ground, and 75s. for impalpable powder. Rottenstone is in more inquiry, and full prices are being paid: £8. 10s. to £15. per ton, according to quality. Ochres and umbers continue to sell steadily at 60s. to 65s. per ton for prime J.C. ochre, and 40s. to 45s. per ton for prime umber. Carbonate and sulphate of barytes are unchanged; the demand has increased, whilst the production has also increased proportionately. Plumbago: The demand continues good for foundries and lubricating qualities at £6. to £10. per ton, whilst imports are slow; prime Ceylon meets with steady demand at £15. to £20. per ton, according to quality. Pumice stone: The demand is steady, ground being done at £6. to £7. per ton, and superior Tenerife lump stone at £7. 10s. per ton. Bog ore is in more request at 22s. 6d. to 25s. per ton. Magnesite: Raw lump and ground are steady at somewhat higher prices. Lead ore: Potters' qualities meet with a steady demand at higher prices.

## REPORT ON MANURE MATERIAL.

There has been a fair inquiry and a moderate amount of business, but prices, except for nitrogenous material, do not show any improvement. The quotations for mineral phosphates are unchanged. There has been some buying of high grade Florida for the North Sea recently, but for the lower grades there is not much disposition to operate. There is nothing fresh to report in River Plate bones, value of cargoes afloat remaining about £3. 15s. per ton. Crushed Kurrachee bones hang fire at £3. 18s. 9d. per ton on spot, and at £4. for shipment. Considerable business has been done in Bombay bone meal, afloat and for shipment, at £3. 15s. per ton, and value on spot is £3. 15s. to £4. per ton, according to quality. Nitrate of soda is firm in all positions. On spot, the value is 7s. 10½d. to 8s. per cwt., according to quality. Due cargoes of ordinary quality are worth about 7s. 10½d. per cwt., and for shipment 8s. to 8s. 3d. per cwt., according to position, is being paid.

## THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, firm: Scotch warrants closed at 47s. 5½d.; Middlesbrough, 38s. 7d. cash, and hematite, 48s. 11½d. Copper, firm: Chili bars, G. O. B.'s and G. M. B.'s closed at £43. 13s. 9d. to £43. 16s. 9d. cash, and £44. 1s. 3d. to £44. 6s. 3d. three months. Tin, firm: Straits closed at £60. 12s. 6d. to £61. 2s. 6d. cash, and £61. 5s. to £61. 15s. three months. Australian, £61. 7s. 6d.; English ingots, £64. 10s. Lead, quiet: Spanish, £11. 5s. to £11. 6s. 3d.; English, £11. 7s. 6d.; Silesian spelter, ordinary, £15. to £15. 2s. 6d. Nickel, 1s. 2½d. Antimony, £29. 15s. Quicksilver: first hands, £7. 2s. 6d.; second hands, £7. 1s. 6d. Copper shares, firm: Cape, 2½ to 2¾; Copiapo, 2 to 2¼; Libiola, 2½ to 3½; Mason and Barry, 2¾ to 3; Rio Tinto, 17½ to 17¾; Tharsis, 4¾ to 5½.

GLASGOW, WEDNESDAY.—Market firm, with large business. Scotch done at 47s. 4d. and 47s. 6d. cash, also at 47s. 6d. and 47s. 8d. one month; closing with buyers at 47s. 5½d. cash, sellers ask 47s. 6d. Cleveland done at 38s. 6d. and 38s. 7d. cash; also at 38s. 8d. and 38s. 9d. one month; closing with buyers at 38s. 7d. cash, sellers ask 38s. 7½d. Cumberland hematite done at 48s. 9d. and 49s. cash, also at 49s. 2d. one month; closing with buyers at 48s. 11½d. cash, sellers ask 49s. Middlesbrough hematite done at 46s. 7d. cash; closing with buyers at 46s. 6d. cash, sellers ask 46s. 7d.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is steady. Lagos has been selling freely at £20. 5s., soft oils £19. 15s., Congo £18, Saltpond and Dixcove £17. 10s. and £17. 5s., all transit. Olive is very firm, with a moderate business doing. Prices are inclined to advance. There is no change in linseed, which is quiet at 20s. 9d. to 21s. per cwt. for Liverpool makes in export casks. Cottonseed is quiet, but quotations for Liverpool refined continue at 17s. 6d. to 17s. 9d. per cwt. Castor is firm, and promises to keep so. There is a good business doing in good seconds Calcutta at 2½d. to 2½d.; first pressure French 2½d. per lb. Tallow is moderate: Norths are quoted about 21s. to 21s. 6d., and Souths 23s. to 24s. Australian 22s. beef, and 23s. 6d. mutton. Resin is rather quiet, prices still standing at 4s. 10½d. for common, 5s. 3d. to 6s. 6d. medium, and 7s. to 8s. per cwt. for fine. Spirits of turpentine are in moderate demand at 21s. 6d. per cwt., spot. Petroleum easier: American 6½d. to 7½d.; Russian refined 6d. per gallon.

COLOURS are steady, without alteration in prices. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## MISCELLANEOUS CHEMICAL MARKET.

Business in the alkali trade is all round fairly satisfactory. There is good inquiry for caustic soda, and prices are well maintained for export. Practically there is no change in current values, which may be taken as last reported, viz.:—F.o.b. Liverpool, 77%, £9. 10s.; 74%, £8. 12s. 6d.; 70%, £7. 12s. 6d.; 60%, £6. 12s. 6d. nett, per ton, 10-ton lots. Some concessions from these prices are made for certain markets. Bleaching powder is still in active demand, and price unaltered at £7., f.o.b. makers' works, and £7. 5s. f.o.b. Liverpool.

Chlorate of potash further advanced to 5d. per lb. Chlorate of soda, 6½d. per lb. Ammonia alkali steady, at £3. 7s. 6d., bags, makers' works. Soda crystals, 37s. 6d. per ton. Bicarbonate of soda, in kegs, £6. 15s., f.o.b. Saltcake firm, at 26s. 6d. f.o.r. For sulphate of copper there is a strong demand, and price firm, at £16. 10s. to £16. 15s., f.o.b. Nitrate of soda on the spot is dearer, at 7s. 10½d. per cwt. Acetate of lime, brown, £4. 15s., c.i.f., and market overstocked. Acetate of soda dearer, at £14. 10s. to £14. 15s., c.i.f. White and brown sugar of lead firm in price, but in only moderate request. For white powdered arsenic a further advance in price is paid, and supply is scarce—price, £17. 15s. to £18. nett, f.o.r. Garston, Potash caustic 90%, £24. 10s. nett, c.i.f., with good inquiry. Carbonate also firm, at £17. 10s. nett for 90%. Yellow prussiate of potash, 7¾d. per lb. Cyanide of potassium, 95/97%, 1s. 2½d. per lb. For crystal carbolic price has still further advanced, and makers are fully sold—price for 39/40%, 8d. per lb. Aniline oil and salt firm, at recent quotations. For green copperas the demand is still active, and prices all round have a higher tendency. Sulphocyanides are in good request, but without improvement in value. The general state of trade in manufacturing districts is still far from satisfactory.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

As regards the general market the feeling continues to be one of encouragement, and of expectation as to a condition of real activity before very long. Prices are all well maintained, and in one or two cases there has been an advance. The firmness is most marked in sulphate of copper, which seems steadily rising, but chlorate of potash, saltcake and sulphur are all likewise hardening. This may also be said to be the case with caustic soda. Dye chemicals are steady and in the bichromates the old convention prices are very well held—both potash and soda. Sulphate of ammonia does not as yet participate in the slight general amendment, but it has suffered no further declension, and £8. 7s. 6d. to £8. 10s. f.o.b. Leith, prompt, is still the range. Nitrate of soda is a shade higher. Mineral oils and paraffins are all, nominally, as before; burning oils and lubricants are steady and firm of price, but there are still strong suspicions of further in-cutting as regards the solid paraffins, about which, however, there has been no open statement on the market.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. 10s. nett, Glasgow; caustic soda, white, 76°/99. 5s., 70/72° £7. 12s. 6d., 60/62° £6. 12s. 6d., and cream 60/62° £6. 10s., all nett, Liverpool; bleaching powder, £6. 5s. to £7. 5s. nett, Tyne; saltcake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 5d. less 5%, Liverpool; nitrate of soda, 7s. 10½d. to 8s. 1½d.; sulphate of ammonia, £8. 7s. 6d. to £8. 10s. prompt, f.o.b. Leith; salammiac, first and second white, £39. and £37. nett, any port; sulphate of copper, £16. 10s., less 5%, Liverpool; paraffin scale, hard, 1¾d., and soft, 1½d. to 1½d. per lb.; paraffin wax, 120° semi-refined, 2¾d. to 2¾d.; paraffin spirit (naphtha), 7½d. to 8d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6¼d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were 30,869 bags unrefined beet.

## HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

OILS.—The situation remains unchanged, with but little variation in prices. The imports up to date (compared during the same time a year ago) have been:—Linseed, 68,130 quarters, against 30,875 quarters. Rapeseed, 5,873 quarters, against 18,965 quarters. Cottonseed, 35,982 tons, against 41,054 tons. Olive oil, 1,850 casks, against 1,475 casks. Rape oil, 557 casks, against 1,481 casks. Oil cakes, 2,991 tons, against 2,057 tons. Tallow, 5,199 cwt., against 2,106 cwt. Bones, 1,093 tons, against 950 tons. Turpentine, 4,167 barrels, against 2,967 barrels. Linseed oil steady, at 19s. 1½d. naked spot. February-April, 18s. 10½d.; May-August, 18s. 9d.; and September-December, 18s. 7½d. to 18s. 6d.; boiled and refined from £1. to £2. per ton extra. The export for the week has been 920 cwt. Refined cotton oil quiet at 15s. 3d. naked spot; February-April offers at 15s. 6d., and May-August at 16s. 3d. Crude, 13s. 9d. naked sellers spot. Casks, £1., and ordinary barrels 30s. per ton extra. Export of refined for the week has been 5,840 cwt. Olive oil, £29. per tun. Spirits of turpentine unchanged. Castor oil improving, but little altered in value.

Cod oil from £16. 10s. to £19. per ton Mineral oil scarce. Neutral liquid soap, £16. per ton. Locomotive grease, £12. per ton.

CAKES.—Linseeds steady: 95% pure, £6. 5s.; Russians, £5. 17s. 6d. per ton. Oil cakes, £5. 2s. 6d. to £5. 5s. per ton. Cotton cakes remain quiet: best makes, £3 11s. 3d.; seconds, £3. 7s. 6d. per ton. Rapeseeds: Black Sea, £2. 7s. 6d.; East India, £3. 7s. 6d. per ton.

PAINTS.—The demand for the time of year is satisfactory. Venetian red, red oxide, black, blue, green, and yellow ochre paints from £11. per ton. Dry mineral colours from £3. 10s. to £9. per ton. White and red leads unchanged. Ultramarines, 3d. to 8d. per lb. Ready-mixed paints, in 1, 2, 4, and 7 lb. self-opening tins, £24. White oxide of zinc unchanged. Paint remover, 25s. per cwt. Oak varnish, 5s. 6d. per gallon. Black varnish, £5. 10s. per ton, in barrels. Natural belt dubbin, 12s. per gallon.

### TYNE CHEMICAL REPORT.

TUESDAY.

Chemicals continue quiet, and there is practically no change to report in prices. Soda crystals are quoted at £2. 2s. 6d. per ton, gross weight. Locally, caustic, 76/77%, £9. 5s.; 70%, £7. 15s. per ton. Sulphur, £3. 17s. 6d. per ton. Other quotations as under:—

Bleaching powder, 50%, £7. 5s. per ton, nett; hard, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, nett weight; gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d.

per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s., per ton, nett; do., 90-95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

SALT.—South Durham salt is steady at 9s. 6d. per ton, f.o.b. Tees.

COALS.—Trade is only dull, and prices, if anything, weaker. Coke is firmer, and in much better demand all round. To-day's quotations:—Best Northumbrian steam, 7s. 9d. to 8s. per ton; second qualities, 6s. 9d. to 7s. per ton; small steam, 3s. 9d. to 4s. per ton; bunker coals, 6s. 3d. to 6s. 6d. per ton; gas coals, 7s. to 7s. 3d. per ton; household coals, 10s. to 10s. 6d. per ton; coke, firm, 14s. to 15s. per ton.

### New Companies.

**Millwall Chemical Co., Ltd.**—CAPITAL £1,000, in shares of £1. each. This company has been formed to work in England, under licence Patent 12,527, 1895, for the dry distillation of sawdust, &c.

**Standard Oil Co. of Galicia, Ltd.**—CAPITAL £100, in £1. shares. This company has been formed to explore test petroleum grounds in Galicia, and to prospect for the oil.

**Standard Wax Candle Co., Ltd.**—CAPITAL £2,000, in £1. shares. This company has been formed to carry on the business of wax candle and night-light manufacturers. There were no articles of association.

**Scottish Acid and Alkali Co., Ltd.**—CAPITAL £25,000, in £5. shares. This company has been formed to carry on the business of manure, soap, paper-pulp, glass, bricks and pottery, coke, cement, and artificial stone manufacturers. The subscribers to the memorandum of association are:—R. Clark, 17, Smith's Place, Edinburgh, wholesale druggist; J. Anderson, The Vaults, Leith, wine merchant; W. D. Rankin, 54, Queen-street, Edinburgh, W.S.; R. H. Steedman, Goltyn, Carrick-road, Ayr, chemical manufacturer; A. M. Maclean, Glenmiln, Camfin Glen, Stirlingshire; W. Campbell, Engine Works, Paisley, engineer; W. Dunlop, 82, W. Regent-street, Glasgow.

### IMPORTS OF CHEMICAL PRODUCTS

#### AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

#### LONDON.

Week ending February 1st.

## LATE ADVERTISEMENTS.

### TENDER.

**WANTED** Tenders for Manufacture of Bromide of Cyanogen (BrCy) for Gold Extraction.  
Particulars as to manufacture can be obtained from Mr. H. PICKARD, 37, Wharfedale, City-road, London N.  
Gold Ore Treatment Company, Ltd.  
60, Gracechurch-street, E.C.

**WANTED** a steady and experienced Tar Distiller.  
—Apply LEVINSTEIN, LTD., Crumpsall Vale Chemical Works, Blackley.

**FOR INDEX  
SEE INSIDE.**

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

**"Expert, Manchester."**

**NATIONAL TELEPHONE 3060.**

Readers will oblige by making their remittances for subscriptions by Postal or Post Office Order, crossed and payable to "Davis Bros."

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion.  
Each additional 10 words ..... 6s. 6d.

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

30 Words and under ..... 1s. 6d. per insertion.  
Each additional 10 words ..... 3s. 3d.

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff rates, which will be forwarded on application.

## CURRENT TOPICS.

### PAINT-EATING HEIFERS.

IT appears that cows are capable of many things besides chewing cud and yielding milk. We know that in the States they make novel advertisement hoardings or sandwich boards, according to whether they are adorned with announcements about soap and pills on one side or both, and now, according to the Crewe County Court Judge, they are prone to browse on paint, by way of a change of diet.

Some paint was left in a cart shed, and to all accounts was partaken of by two heifers, for a farm labourer stated that he had driven them away from the pots, which had been overturned. The repast seemingly did not agree with them, and they were examined by a veterinary, who pronounced them to be suffering from lead poisoning. Eventually they died, and on the owner bringing an action against the painter he obtained £12. damages.

The evidence was on the whole dead against the possibility of the heifers eating the paint, the veterinary himself admitting that during his twenty years' experience he had never actually known cattle eat paint, though he had read of cases. His admission shows that this gentleman was much more careful and considerate in laying his charge against the paint than his brother "vet.," who, as stated elsewhere in this issue, attributes the death of sheep to blood poisoning contracted by eating turnip shells, grown with bone manure, presumably made from diseased bones. *Prima facie* the paint case is far more probable.

We do not know how the Crewe County Court Judge would have decided in the manure case, but he evidently was convinced that this heifer case was the exception that proves the rule, and gave judgment accordingly. The fact should be noted by the trade, as, although the defendant stated that he had never in a long experience in the paint trade found it worth while to protect his paint pots from cattle, it will be worth while doing so in future, since, be custom and experience what they may, the law has created a precedent contrary to both, and the law is the law.

### THE POSITION OF COPPER.

Amongst the articles that have been fortunate enough to show that they are improving with trade, copper has, both in its statistical position and price, evinced promising possibilities. There is plenty of room for improvement, and this metal seems to have set about the task in real earnest.

The change for the better is mainly due to the heavy deliveries during the early part of January, and the absence of supplies on the usual scale to compensate the depletion of the stocks.

During the last two weeks the deliveries have also been about 2,200 tons in excess of the arrivals.

In consequence the visible stock, which at the beginning of February stood at 46,128 tons, has been reduced to 43,916

tons, which is the lowest total that has been reached under any circumstances during the last three years.

Though the statistical position is, therefore, the best that has been experienced since 1893, the same cannot be said as regards prices, for although there has been an advance of £2, or rather better during the last fortnight, prices are still considerably below the level reached in August, when the market was active. At present the demand is keeping steady, so that, if anything, the chances are in favour of prices ranging higher, and so approximating more closely the £47 reached last autumn.

#### THE FRENCH PHOSPHATE COMBINE.

The combination of the Somme producers is making headway, and at a meeting held last week at Péronne delegates were appointed to form a representative committee. The Combine is practically composed of three parties, comprised largely of those who were members of the old Lagache Syndicate, still more largely of those who deal through MM. Hébré and Girault, and, lastly, of the minority who have not been associated with any combination heretofore. The committee has been made up of four delegates representing each section, making twelve members in all, who will meet at Amiens to ascertain the production of each works, and so regulate the same as to keep the total production in touch with the demand. As soon as this has been done the Combine will be consolidated. It is uncertain as yet whether all the business will be done through one house, but such an arrangement is improbable, it being far more likely that each section will have its own broking house, though the three sales departments will work in concert with each other.

The step is more or less justified by the results of the Florida Combine, but it remains to be seen how far the Algerian producers interfere with its working, although their law only enables them to operate against the exercise of the Combine in Algeria.

#### TRADE CATALOGUES AND THE PATENT OFFICE.

THE following correspondence with regard to the filing of trade catalogues at the Patent Office has passed between Mr. K. B. Murray, secretary of the London Chamber of Commerce, and Sir H. Reader Lack:—"To Sir Henry Reader Lack, Comptroller-General, Patents, Designs, and Trade Marks Office, 25, Southampton-buildings, Chancery-lane, W.C., 27th January, 1896. Sir,—The attention of this chamber has been called to the fact that the librarian of the Patent Office of the United States of America is making a collection of illustrated and other trade catalogues, price lists, circulars, and other similar publications for reference by those instituting inquiries in regard to patents, designs, and trade marks, or making use of the Patent Office Library. I am desired to say that, in the opinion of this Chamber, such a collection of records in your department would be exceedingly valuable, and am directed to bring the suggestion before the authorities of Her Majesty's Patent Office as one which it would be well to adopt. By this means there would be permanently preserved an enormous amount of extremely useful material which might on occasion elucidate the meaning of many trade terms and usages. If such a collection and filing were adopted by the Patent Office it would, no doubt, be extremely serviceable and be largely resorted to by those interested in patents, designs, and trade marks. I am desired to express the hope that this suggestion will receive the careful consideration of the authorities of her Majesty's Patent Office, and I shall be glad to learn their decision in the matter.—I am, Sir, yours faithfully, KENRIC B. MURRAY, Secretary." To this the following reply was sent:—"25, Southampton-buildings, Chancery-lane, London, W.C., 29th Jan., 1896. Sir,—I beg to acknowledge the receipt of your letter of the 27th instant., suggesting, on behalf of the London Chamber of Commerce, that a collection of illustrated and other trade catalogues, price lists, and similar publications should be made and filed in the Patent Office Library, and, in reply, to inform you that the nucleus of such a collection was formed some 20 years ago, and has since that date been gradually extended. In view, however, of the suggestion of the London Chamber of Commerce, I shall be happy to consider how far it may be possible to render this collection more complete and to make it more accessible for public reference.—I am, Sir, your obedient servant, J. L. READER LACK, Comptroller-general."

## Parliamentary Jottings.

#### PETROLEUM ACCIDENTS.

In the House of Commons on Monday, Mr. Boulnois (Marylebone, E.) asked the Secretary of State for the Home Department whether his attention had been called to the large increase in the number of deaths resulting from accidents caused by the use of dangerous lamps for mineral oil (largely made in Germany); and whether he would consider the advisability of reappointing the Select Committee of 1894, with a view to prevent the sale of such lamps.

Mr. Collings (Birmingham, Bordesley), in the absence of Sir M. W. Ridley, said—The Secretary of State has carefully considered this question, in accordance with the undertaking which he gave when replying to a similar question in August last, and he hopes to be able to secure the re-appointment of the Select Committee.

#### THE CHESHIRE SUBSIDENCE BILL.

The Brine Pumping (Compensation for Subsidence) Bill, suspended under the Standing Order of last session, was passed through all its stages this week.

#### NEW RIVERS POLLUTION BILL.

Among the Bills for which powers have been granted for introduction to the House of Commons, there is a Bill backed by Mr. Wyvill to make more effectual provision for prevention of the pollution of rivers and streams.

## IMPORTS AND EXPORTS FOR JANUARY.

THE Board of Trade returns for the past month are fairly satisfactory. The most notable increases in the imports of interest to the trade have been in rosin, tallow, and india-rubber.

#### IMPORTS OF FOREIGN AND COLONIAL PRODUCE.

**PETROLEUM FUEL.**—The German Admiralty is experimenting with the use of petroleum as fuel on board three torpedo boats. The results attained so far are understood to be favourable. The small ironclads *Odin* and *Aegir* are now to be adapted for the new fuel, which will also, it is expected, be introduced in the iron clad *Ersatz Preussen*, now being built.

**COST OF APPARATUS FOR GENERATING X RAYS.**—The *Photogram* says:—"The cost of apparatus has been the chief stumbling block to would-be "shadowgraphers" by the Röntgen rays. A doctor at Edinburgh has just obtained satisfactory results with an outfit which costs—including both the electrical and the photographic apparatus—only just over three pounds.

## The Patent List.

This list is compiled from Official sources in the Manchester Chemical Laboratory, under the immediate supervision of E. E. Davis and Alfred R. Davis, who report professionally the value of Chemical Patents.

**APPLICATIONS FOR ENGLISH LETTERS PATENT.**  
 Drying Cattle Foods and Disinfectants from Waste Products. W. H. Saville. 2,445. February 3.  
 Manufacture of Sodium and Potassium Silicates and of Nitric and Sulphuric Acid. W. Garraway. 2,459. February 4.  
 Extracting and Recovering Oil from Fish and Fish Refuse, etc. J. Jack & M. Blake. 2,511. February 4.  
 Producing Nitrogenous and other Substances. J. S. Wallace and J. Castellans. 2,542. February 4.  
 Tanning. H. L. J. Roy. 2,572. February 4.  
 Polytical Extraction of Caustic Alkali and Hydrochloric Acid from Chloride. A. J. Boulton. 2,594. February 4.  
 Extracts from Apatite and other Mineral Phosphates. J. G. Wiborg. 2,595. February 5.  
 Manufacture of Pigments. H. and S. H. Hawkins. 2,681. February 5.  
 Kilns. H. Simmonds and J. Delaney. 2,943. February 7.  
 Improved Soap. J. Stockhausen. 2,996. February 8.  
 Motor Furnaces for Town's Refuse. S. Willoughby. 2,901. Feb. 8.

### EXTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal. ALL RIGHTS OF PUBLICATION ARE RESERVED. This is the earliest of abstracts of Chemical and allied patents accessible to the public.

**Improvements in the Manufacture of Chlorine by means of Magnesium Chloride.** T. H. Bell, Middlesbrough (communicated by T. Schloessing, 67, rue d'Orsay, Paris). Eng. Pat. 3,439. February 15th, 1895.

This patent describes apparatus for dehydrating the chloride of magnesium used in patent 11,821, 1887. The chloride is passed through a series of vertical, externally heated, cast iron cylinders fitted with conveyors and filled with HCl gas. To obtain perfect dehydration it is necessary to heat the chloride to a temperature that the acid to attack the cylinders. The final drying is therefore effected in a separate chamber unattacked by the acid at a high temperature.

HCl used is generally that resulting from the partial decomposition of the magnesium chloride grains while drying. This gas contains aqueous vapour, and two methods of removing the same are described: one by scrubbing the gas with vitriol, and the other by passing it through a water-cooler, which condenses the vapour, and when allowed the HCl gas to pass. Means are described for controlling the vitriol used in the scrubbers. Lastly apparatus is described for obtaining the gaseous chlorine from the perfectly dehydrated magnesium chloride. There are in all twelve drawings.

**Improvements in and Relating to the Collection and Analyzing of Gases.** F. G. Waller, Director of the Nederlandsche Gist en Spiritusfabriek, Delft, Holland. Eng. Pat. 1,040. January 16th, 1895.

Two cylinders are connected by a pipe, the second cylinder being one-third the size of the first, and containing a float carrying a piston. On setting the syphon and opening the large cylinder to the atmosphere, a current of gas is gently aspirated, according to the flow of the syphon. For details, the drawing which accompanies the specification must be consulted.

**Improvements in the Production of Zinc Chlorides.** C. Hoepfner, 36, Markfurterstrasse, Giessen. Eng. Pat. 5,662. March 18th, 1895.

In order to convert zinc oxide into the chloride, the former is treated with magnesium chloride or zinc chloride in which the oxide is soluble. The basic solution so obtained is converted into a neutral solution by treating with carbon dioxide. The precipitated zinc carbonate is then converted into chloride according to patent 11,724/94, the magnesium chloride being left for use over again. The solvent chlorides and by-products such as residual liquors from manufacture of zinc chloride, chlorate of potash, and ammonia soda, since an effective method is to treat the zinc oxide with a strong solution of a chloride and CO<sub>2</sub> to form chloride of zinc and calcium carbonate.

**Improvements in the Extraction of Gold and Silver from Ores and Slimes.** J. S. McArthur, 12, Knowl Terrace, Pollokshields, Renfrewshire, J. Yates, 13, West Scotland-street, Kinning Park, Glasgow. Eng. Pat. 2,418. April 2nd, 1895.

This patent is essentially a mechanical one. A vertical shaft carrying amalgamated plates, corrugated to give a large surface, is caused to revolve in a round wooden tank. If preferable the plates can be fixed to a tank revolved. In working, the tank is charged with powdered ore and a solution of cyanide, or other salt that will assist the solution

of the gold, &c. The charge is then stirred by setting the shaft or tank in motion, until all the gold has been caught on the amalgamated plates. There are four drawings.

**Improvements in the Production of Cyanogen Compounds.** E. A. Morgans, Broad-street House, Old Broad-street, London. Eng. Pat. 2,660. Feb. 6th, 1895.

Cyanogen, or compounds such as the chloride and flouride, are produced for treating auriferous ores by decomposing potassium cyanide by electricity, or chemically by means of sulphuric acid and manganese dioxide. To produce the chloride a solution of salt and a decomposable cyanide is electrolysed. Another method is to decompose a mixture of bleaching powder and potassium cyanide with hydrochloric acid, the gases in all cases being used for the treatment of gold and silver ores, either direct or after storage by solution or compression into cylinders.

**Improvements in the Manufacture of Sulphuric Acid.** U. F. Benker, 115, Rue Martre, Clichy, France. Eng. Pat. 1,168. Jan. 17th, 1895.

In the manufacture of vitriol it is frequently found that the Gay-Lussac tower allows yellow gases to escape. Increasing the flow of H<sub>2</sub>SO<sub>4</sub> down the towers, or enlarging the area of the latter, does not overcome this difficulty. The patentee ascribes the loss to the presence of excess of hyponitric acid, which is practically insoluble in sulphuric acid of 60° Bé when carried over by a large volume of gas. It is claimed that by injecting sulphurous acid gas into the last chamber or the last portion of a large chamber situated before the Gay-Lussac tower, the percentage of nitrous acid in the Gay-Lussac acid is materially increased, and the gases leave the tower white, or nearly so. The injector is of special construction, and is explained by three drawings.

**Process for the Manufacture of Carbides or Acetylides of the Earth Metals and Alkali-Earth Metals, and of the Oxides or Salts of these Metals.** L. M. Bullier, 12, Avenue d'Orleans, Paris. Eng. Pat. 2,820. Feb. 8th, 1895.

The object is to produce calcium carbide on a commercial scale for the preparation of acetylene, which is done by heating, say, 56 parts of quicklime and 36 of sugar charcoal or lamp black in a Moissan electric furnace, which gives a carbide having the formula CaC<sub>2</sub>. Where other bases, such as barium or strontium, are used, the hydrate left after decomposing the carbide with water to give acetylene gas, is dissolved in acids such as nitric acid, forming valuable salts.

## EXPORTS OF PETROLEUM FROM U.S.A.

THE Chief of the Bureau of Statistics, Washington, gives the following returns of the exports of petroleum and petroleum products for December, 1895. The total shipments were 80,858,246 gallons, compared with 83,060,220 gallons in 1894. The total for the twelve months ending December, 1895, was 853,126,130 gallons, against 894,862,159 gallons during the same period in 1894. The details of the shipments are as follow:—

|                       | CRUDE PETROLEUM.          | Gallons.   |
|-----------------------|---------------------------|------------|
| Total, December, 1895 | .....                     | 10,798,891 |
| " " 1894              | .....                     | 8,140,778  |
|                       | NAPHTHAS.                 |            |
| Total, December, 1895 | .....                     | 2,297,200  |
| " " 1894              | .....                     | 1,565,285  |
|                       | ILLUMINATING.             |            |
| Total, December, 1895 | .....                     | 63,482,769 |
| " " 1894              | .....                     | 70,043,714 |
|                       | LUBRICATING AND PARAFFIN. |            |
| Total, December, 1895 | .....                     | 3,962,538  |
| " " 1894              | .....                     | 3,309,939  |
|                       | RESIDUUM.                 |            |
| Total, December, 1895 | .....                     | 43,848     |
| " " 1894              | .....                     | 504        |

**THE CUBAN SUGAR CROP.**—According to the latest information, the Cuban sugar crop for this year is estimated as low as 100,000 tons, against 1,100,000 last year, owing to the damage caused by the revolution. The most sanguine estimate was 300,000 tons. The market is accordingly strong.

**PROSPECTING FOR COAL AT IRLAM.**—Boring operations are now being prosecuted by the Manchester Corporation on Irlam Moss in search of coal. A depth of between 50 and 60 feet has already been reached, 13 feet of moss, 18 feet of clay, and seven or eight feet of gravel having been passed through. It is believed that valuable seams of coal underlie the whole of the Irlam Moss, and further that they are of a reasonable depth.

## Correspondence.

\*We do not hold ourselves responsible for the opinions expressed by our correspondents.

### IS THERE ANY DANGER IN BONE MANURES?

(To the Editor of the Chemical Trade Journal.)

SIR,—A farmer, who for many years has used bone manure for his roots, and used 6 cwt. per acre, has lost a large number of ewes, the ewes eating the shells of the turnips, after the ewe hogs. A veterinary has given his opinion that the sheep died from blood poison. He says it was caused by the bone manure. He also says that some of the bone may be from animals that died from infectious disease, and that the bone from diseased animals would cause the sheep to die from blood poison. I should say the bones were dissolved in acid before Christmas, 1894, and in June or July, 1895, the manure was used for the turnips; the above sheep did not eat the turnips till January and February, 1896. For my part I should say it would be impossible, if part or the whole of the bone came from diseased animals, that, after being dissolved and then applied to the land, and the turnips grown from the manure for any animal eating the turnips they should be poisoned. I may say I supplied the manure. Will you be so good as to give me your opinion, and I should be glad to hear the opinion from any of your many readers of the *Chemical Trade Journal*. If what the veterinary says is true it will be a great blow for bone as a manure?—Yours, &c., T. C. G.

[We are inclined to think, with our correspondent, that they must be very hardy disease germs to withstand vitriol. We should think the short commons left after the ewe hogs had finished had more to do with their demise.—ED., C.T.J.]

## Trade Notes.

**COPPER IN PEAS.**—At the Southwark Police Court recently, H. C. Summers, trading as George Mence Smith, at High-street, Borough, appeared to an adjourned summons taken out at the instance of Mr. Arthur A. Grist, sanitary inspector to the St. Saviour's District Board of Works for selling preserved peas mixed or coloured with an ingredient injurious to health—namely, eight-tenths of a grain of copper per pound of peas. Mr. Frank Dodd, barrister, prosecuted on behalf of the parish; and Mr. Bonsey, barrister, defended. Further evidence for the defence was given by Dr. Paul, F.I.C., and, having heard Mr. Bonsey, Mr. Fenwick said it was an important matter, and he would adjourn the case in order that he might consider his decision.

**COMPARISON OF X RAYS WITH ORDINARY LIGHT.**—Some interesting experiments have been made by a gentleman in Renfrew who has obtained shadowgraphs of different objects through wood and other substances between the poles of an induction machine made on Mr. Wimshurst's principle. He has also found, both with the rays—X or otherwise—excited by a highly-exhausted vacuum tube, or by the Wimshurst induction machine without any vacuum tube, that on placing strips of gelatine, coloured, in various thicknesses, in front of a photographic plate, the blue is least sensitive, red next, and yellow most; in other words, the waves which penetrate the coloured media are exactly opposite to those of light. In ordinary photography, to place blue glass in front of the window of your dark-room would be to insure all the actinic rays falling on your work, so red and yellow are employed; while with these X rays a blue glass cuts them out completely. This apparently explains why German glass is so much better than English for the vacuum tubes in which the X rays are to be produced. German glass at high exhaustion phosphoresces a yellow-green colour; English, a beautiful blue. The English glass is opaque to the X rays, while the German is transparent. The conclusion is that the rays can be excited without a vacuum tube in ordinary air, and that they are not ultra-violet.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are steady, prices being much the same as last week. Carbolic acids are very firm, and a further advance has been made during the week: Crude, 60%, is now quoted 2s 3d., and 40% crystals 8½d. Solvent naphtha and crude remain at 1s 6d. and 10d. respectively. Anthracene and creosote unaltered. Pitch has been in better demand, with prospect of steadiness, at 35s., f.o.b., East Coast.

Sulphate of ammonia is reported lower, but the values are mainly nominal. Speculators have apparently covered their needs, and are

now trying to depress the market. There has been a striking absence of orders during the past few days. Nearest values are:—Beckton £8. 7s. 6d., London outside makes £8. 8s. 9d., Liverpool, Hull, and Leith all £8. 10s., prompt. Nothing is doing in forward. Nitrate quiet.

### LIVERPOOL MINERAL MARKET.

Our market for minerals has on the whole ruled very firm during the week. Manganese arrivals continue very slow, whilst the demand has been materially increased; spot stocks have been entirely cleared, and prices have considerably advanced, with a stronger prospect for the future. Ground manganese has therefore improved, and meets with a good demand at £7., £9., £11., and £13. 10s. per ton. Sulphate of manganese continues to sell freely. Manganiferous iron ore is in strong demand, and prices have advanced fully 1s. or 1s. 6d. per ton. Chrome ore: Arrivals have somewhat increased; prices are unaltered. Bauxite: The demand continues good, and is likely to do so in view of the increase in the consumption, where large quantities will be required; prices are firm at 20s. per ton for first, 16s. per ton for second, and 12s. per ton for third quality, f.o.b. French chalk: Arrivals do not keep pace with the demand, and stocks are nil; prices are therefore strong at 70s. to 75s., 80s. to 90s., and 100s. to 110s. per ton for "Angel White" brands, according to grade. Wolfram and scheelite: Spot stocks are very low, especially of high grade; prices are therefore firm, with a tendency to increase. Arsenic continues strong at £17. to £19. per ton. Fuller's earth steady at unaltered prices—55s. for ground, 75s. for impalpable powder, and 50s. for lump. "Emerald" and other brands. Rottenstone: The demand for prime qualities is good at full prices—£8. 10s. to £14. per ton, according to grade. Ochres and umbers sell readily, good staining qualities being in demand; 60s. to 65s. per ton for J.C. ochre, and about 40s. per ton for umber. Carbonate and sulphate of barytes are in improved demand at full prices. Plumbago: The demand continues good, especially for foundry and lubricating qualities, which sell freely at £6. to £10. per ton, according to grade; prime Ceylon is in steady demand at £15. to £20. per ton, according to quality. Pumice stone is inquired for, ground being done at £6. to £7. per ton, and superior Teneriffe lump being done at £7. 10s. per ton. Bog ore is in fair demand at 22s. 6d. to 25s. per ton. Magnesite: Raw lump and powdered are steady at somewhat higher prices.

### THE METAL MARKETS.

**LONDON, WEDNESDAY.**—Pig iron, lower: Scotch warrants closed at 47s. 1d.; Middlesbrough, 38s. 2d. cash, and hematite, 48s. 7d. Copper, weaker: Chili bars, G. O. B.'s and G. M. B.'s closed at £45. to £45. 5s. cash, and £45. 7s. to £45. 12s. 6d. three months. Tin, easier: Straits closed at £60. 7s. 6d. to £60. 17s. 6d. cash, and £60. 17s. 6d. to £61. 7s. 6d. three months. Australian, £61.; English ingots, £64. 10s. Lead, firm: Spanish, £11. 7s. 6d.; English, £11. 10s.; Silesian spelter, ordinary, £15. 2s. 6d. Nickel, 1s. 2½d. Antimony, £29. 10s. to £30. Quicksilver: first hands, £7. 2s. 6d.; second hands, £7. 2s. Copper shares, quiet: Cape, 2½ to 2½; Copiapo, 2½ to 2½; Libiola, 3 to 3¼; Mason and Barry, 2¼ to 3; Rio Tinto, 18½ to 18½; Tharsis, 5 to 5¼.

**GLASGOW, WEDNESDAY.**—Market steady, with small business. Scotch done at 47s. 1d. and 47s. 1½d. cash, also at 47s. 3½d. one month; closing with buyers at 47s. 1d. cash, sellers ask 47s. 1½d. Cleveland closes with buyers at 38s. 2d. cash; sellers ask 38s. 3d. Cumberland hematite done at 48s. 7d. cash, closing with buyers at 48s. 7d. cash, sellers ask 48s. 7½d. Middlesbrough hematite done at 46s. 2d. and 46s. 2½d. cash; closing with buyers at 46s. 2d. cash, sellers ask 46s. 2½d.

### REPORT ON MANURE MATERIAL.

The market has been quiet during the greater part of the week, and so far as there has been any change in values it has been in buyers' favour.

The Continent is still inquiring for 75/80% Florida rock, and it is reported that further business has been done to a cotton port at 6d. per unit. United Kingdom buyers still hang back. Quotations for Peace River, South Carolina River, and Algerian rocks are unchanged.

There is nothing fresh to report in River Plate bones. On spot, £4. per ton required for crushed Kurrachee bones, but for shipment £3. 17s. 6d. would now do. Bombay bone meal offers at £3. 15s. per ton, for shipment, and a shade less would probably do for parcels arrived ex quay Liverpool.

Nitrate of soda is quiet but firm. Due cargoes are worth about

7s. 10½d. per cwt., ordinary quality. On spot there are sellers of ordinary quality at 7s. 10½d. per cwt., and of fine quality at 8s.

Home-prepared dried blood, fine test, offers at 7s. 6d. per unit of ammonia, free on rails at works.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is steady. There has been a fairly good business doing, though to-day things are rather quieter. Olive is strong, and prices have been advanced about 10s. to 20s. per tun. Spanish is quoted £27. 15s. to £28. 10s., according to shipment. Linseed is firm, with a moderate inquiry for Liverpool makes in export casks at 20s. 6d. to 21s. per cwt. Cottonseed is steady, though rather easier, Liverpool refined now being quoted 17s. 3d. to 17s. 6d. per cwt. Castor oil is unchanged, good seconds Calcutta standing at 2½d. to 2¾d., and first pressure French rather easier at 2¾d. ex quay, and 2½d. per lb. store. Tallow, though still fairly well inquired for, is quieter. Resin is in small demand, spot parcels moving fairly well at full prices. Spirits of turpentine are firm at 21s. 6d. per cwt., spot. Petroleum quiet: American 6½d. to 7½d., and Russian refined 6d. per gallon.

COLOURS are steady, without alteration in prices. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## MISCELLANEOUS CHEMICAL MARKET.

In the alkali trade there are no changes of any consequence to note during the past week. The works are all fairly engaged with orders for export and home trade. Caustic soda is, if anything, a turn easier, and current quotations may be taken as follows:—F.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 10s.; 70%, £7. 10s.; 60%, £6. 10s. per ton, 10-ton lots and upwards. Bleaching powder very firm, at £7., f.o.b., makers' works, for home trade, and £7. 5s. hardwoods, f.o.b., subject to some exceptions for certain markets. Chlorate of potash 4½d. per lb., though some resales may be had still at a fraction lower. Chlorate of soda, 6½d. to 6¾d. per lb. Sulphur, £3. 12s. 6d., f.o.b. Saltcake firm, at 25s. in bulk. Alkali, 58%, in bags, steady, at £3. 7s. 6d. makers' works. Soda crystals, 37s. 6d. per ton, bags, f.o.b. Sulphate of copper has undergone further advance to £17. 5s., f.o.b. White powdered arsenic, £18. 10s. to £19. paid for March-April, and supplies are insufficient for requirements. Carbolic crystals further advanced to 8½d. for 39/40°, and very scarce. Acetate of lime nominal, at £4. 15s. to £5., c.i.f., for brown, but no buyers. Grey, £8. to £8. 10s. per ton. Sugar of lead in rather slow demand in all qualities, and prices unaltered. Yellow prussiate of potash easier, at 7½d. per lb. Cyanide, 95/97%, at 1s. 2½d. per lb. Muriate of ammonia in fair demand, at £23. per ton. Other ammonia salts steady in price, and in moderate request. Potash, caustic and carbonate, continue to sell freely, and are without alteration in values. Reports generally agree as to quietness of trade in all districts.

## TYNE CHEMICAL REPORT.

TUESDAY.

Chemicals continue dull, with only a moderate demand. Prices are still on a basis of £2. 2s. 6d. per ton, gross weight, locally, for soda crystals: £9. 5s. per ton for 76/77% caustic, and £7. 10s. to £7. 15s. for 70%. Sulphur, scarce, at £3. 17s. 6d. per ton. Other quotations as under:—

Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined,

£6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

SALT.—South Durham salt, unchanged, at 9s. 6d. per ton, f.o.b. Tees.

COALS are only quiet, with moderate business doing. A large Swedish contract for gas coals has just recently been booked to the Tyne, the price showing a slight reduction as compared with last year. Coke is firmer, and there is a good demand for home consumption. To-day's quotations:—Best Northumbrian steam, 7s. 9d. to 8s. per ton; second qualities, 6s. 9d. to 7s. per ton; small steam, 3s. 9d. to 4s. per ton; bunker coals, 6s. 3d. to 6s. 6d. per ton; gas coals, 7s. to 7s. 3d. per ton; household coals, dull, 10s. to 10s. 6d. per ton; coke, firm, 14s. 6d. to 15s. 6d. per ton.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

During the course of last week sulphate of ammonia plucked up a little more, and now there seems to be no sellers under from £8. 11s. 3d. to £8. 12s. 6d. spot, Leith. At the same time inquiry is not by any means brisk, which accounts for the light character of the advance. There is nothing at all doing in forward supplies, anything as yet offered being much too low to tempt even the least unwilling of makers. The figures against the solid paraffins, as given below, stand unchanged, but buyers are to note that for actual business lower quotations are certainly to be had, from some of the producers at least, although these concessions are kept very quiet. The paraffin oils are all in fair demand at prices pretty well maintained. The general chemicals market continues to retain and improve the recent better feeling, and prices are all firm. Prompt business is not increased as yet to any great degree, but inquiry about forward supplies is active.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. 10s. nett, Glasgow; caustic soda, white, 76° £9. 5s., 70/72° £7. 12s. 6d., 60/62° £6. 12s. 6d., and cream 60/62° £6. 10s., all nett, Liverpool; bleaching powder, £6. 5s. to £7. 5s. nett, Tyne; saltcake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4½d. nett, f.o.b. Glasgow); bichromate of soda, 3¾d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 5d. less 5%, Liverpool; nitrate of soda, 7s. 10½d. to 8s. 1½d.; sulphate of ammonia, £8. 11s. 3d. to £8. 12s. 6d. prompt, f.o.b. Leith; salammioniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £16. 10s. to £16. 15s., less 5%, Liverpool; paraffin scale, hard, 1¾d., and soft, 1¾d. to 1¾d. per lb.; paraffin wax, 120° semi-refined, 2¾d. to 2¾d.; paraffin spirit (naphtha), 7½d. to 8d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6¾d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were 69,138 bags beet unrefined and 500 bags beet refined.

## HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

OILS.—The market for seed oils remains very quiet, with prices little changed, with the exception of linseed oil, which has declined 5s. per ton. Some change in the price of cottonseed oil is evidently expected in the future, more than appears upon the surface, by those who "know," if the large amount being constantly warehoused is a sure criterion; no doubt the very open season and the present slow demand for cakes may have more influence upon future prices than the present. The import of linseed during the week has been 3,250 quarters, making a total for the year of 71,380 quarters, against, for the same period a year ago of 37,161 quarters. Linseed oil has declined about 5s. per ton on the spot, closing quiet at 18s. 10½d. naked; March-April offers at 18s. 9d.; May-August, 18s. 7½d.; and September-December, 18s. 6d.; boiled and refined from £1. to £2. per ton extra. The export for the week has been 1,680 cwt. The import of cottonseed for the week has been 2,641 tons, making a total for the year of 38,623 tons, against 47,674 tons a year ago. Refined cotton oil remains quiet at 15s. 3d. naked, spot; March-April, 15s. 4½d.; and May-August, 16s. 1½d. Crude worth 13s. 7½d. spot, naked. Casks £1. and ordinary barrels £1. 10s. per ton extra. Olive oil, £29. Spirits of turpentine, 21s. 9d. Castor oil unchanged. Cod oil from £16. to £19. per ton. Neutral liquid soap, £15. per ton. Locomotive grease, £12. per ton.

CAKES.—The continued open weather is unsuited for a good demand in feeding cakes. Linseed cakes: 95% pure, £6. 5s. per ton; Russians, £5. 17s. 6d. to £6. 2s. 6d. Oil cakes, £5. 2s. 6d. Cotton cakes have a little firmer tone: best makes, £3. 10s. 6d.

£3. 11s. 3d.; seconds, £3. 6s. 3d. Rape cakes: Black Sea, £2. 6s. 3d.; East India, £3. 7s. 6d. per ton.

PAINTS.—The demand for the time of year continues good and increasing, with prices unchanged.

## New Companies.

**Clarkson-Stanfield Ore Reduction Co., Ltd.**—CAPITAL, £100,000., in £1. shares. This company has been formed to work inventions for the treatment of ore without water. The subscribers to the memorandum of association are:—P. Strickland, 6, Crosby-square, E.C., broker; J. Drake, 6, Crosby-square, E.C., clerk; W. S. Lee, 6, Great Winchester-street, E.C., secretary; W. A. Hills, Panmure-road, Sydenham, metallurgist; E. H. Davies, 6, West-cliff, Eastbourne, engineer; P. A. Thomas, 35, Queen Victoria-street, E.C., engineer; H. F. Brown, 43, London Wall, E.C., solicitor.

**Walkers, Ltd.**—CAPITAL, £40,000., in £10. shares, of which 2,000 are preference. This company has been formed to carry on the business of tanners, curriers, etc. The subscribers to the memorandum of association are:—W. S. Walker, Wood Bank, Erith, tanner; A. J. Walker, Wood Bank, Erith, tanner; W. Walker, Oak Lea, Whitehaven, tanner; H. W. Walker, Oak Lea, Whitehaven, tanner; A. Walker, Oak Lea, Whitehaven, tanner; C. H. Walker, Wood Bank, Erith, tanner; Mrs. E. Walker, Wood Bank, Erith.

**Minbu Oil Co. of Burmah, Ltd.**—CAPITAL £20,000., in £10. shares. This company has been formed to acquire 7½ square miles of land in Upper Burmah, and to carry on the business of oil refiners, etc., drysalers, and paint and colour manufacturers. The subscribers to the memorandum of association are:—R. G. Orr, 73, Fitzjohn's-avenue, Hampstead, merchant; H. Gibson, 8, Great St. Helens, E.C., solicitor; S. S. Gladstone, 67, Cornhill, E.C., merchant; J. F. Ogilvy, 67, Cornhill, E.C., merchant; A. Stuart, 21, St. Mary Axe, E.C., gentleman; C. L. W. Jackson, Normandy Hall, N.R., Yorks.,

gentleman; B. Parker, St. Michael's Rectory, Cornhill, solicitor.

**Amelia Nitrate Co., Ltd.**—CAPITAL, £155,000., in 500,000 shares of £10. ordinary £10. shares. This company has been formed to adopt an agreement with Weber and Co. to acquire certain nitrate grounds near Pisagua. The subscribers memorandum of association are:—W. Greenwell, 2, Finch-lane stockbroker; A. Q. Faslem, 17, Phillbeach Gardens, S.W., mer; H. G. Schmidt, 17, Hardenburg-street, Charlottenburg, mer; Schroder, 145, Leadenhall-street, E.C., merchant; E. Steindinandstr., 56, Hamburg, merchant; G. Stielow, 3, Bernard Russell-square, retired; H. F. Tiarks, 145, Leadenhall-street, merchant.

**Ramsbottom Paper Mill Co., Ltd.**—CAPITAL, £144,000. 54,000 preference shares of £1. and 18,000 ordinary of £5. company has been formed to acquire the business of the Ramsbottom Paper Mill Co. and to trade as papermakers, importers, deal brokers, etc. The subscribers to the memorandum of association are:—E. Partington, Caston, Glossop, paper manufacturer; T. Holcombe Hall, Ramsbottom, manufacturer; C. L. Sams Booth-street, Manchester, solicitor; R. P. Skelton, Tower Ramsbottom, papermaker; J. Greenhalgh, Irwell Mount, bottom, manager; J. A. Porritt, The Cliffe, Ramsbottom, facturer; J. H. Maden, Spring Bank, Ramsbottom, agent.

## Gazette Notices.

### PARTNERSHIP DISSOLVED.

J. HEARLE, M. A. HEARLE, and P. H. DAWES, manure and agricultural makers, Penryn, under the style of J. Hearle and Son.

G. WADDINGTON and W. G. L. HARVEY, bone boilers and fat melters, W. Lane, Hackney Wick, N.E.

### BANKRUPTCY ACTS, 1883 and 1890.

CROSSLEY, CHAS. PLATT, Ipswich, oil cake broker.

## LATE ADVERTISEMENT.

**CHEMICAL PLUMBERS.**—Wanted at once, for large Works, Two experienced Chemical Plumbers. Best wages to steady men—Address, with full particulars, age, and references, to "PLUMBER," *Chemical Trade Journal* Office, Manchester.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*,—payable in advance,—including postage to any part of the world, are as follows:—

Yearly (52 numbers) ..... 12s. 6d.

Half-Yearly (26 numbers) ..... 6s. 6d.

Quarterly (13 numbers) ..... 3s. 6d.

Readers are invited to forward items of intelligence, or cutting from local newspapers, of interest to the trades concerned.

Readers will oblige by making their remittances for subscriptions by Postal or Post Office Order, crossed and payable to "Davis Bros."

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than **Tuesday morning**.

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion  
Each additional 10 words ..... 6s. 6d.

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz:—

30 Words and under ..... 1s. 6d. per insertion  
Each additional 10 words ..... 6s. 3d.

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff rates, which will be forwarded on application.

## CURRENT TOPICS.

### GALICIAN PETROLEUM.

AS the production of oil in Galicia increases with the extension of the wells, this industry is gradually assuming more important proportions. The home trade is now well established, and the producers are apparently preparing to enter into competition with other producers. To do so entails under-selling to a large extent, but the producers seem equal to the occasion, for they are raising the price of crude consumed on the spot to recover the reduction on the exports.

This step appears to be causing considerable consternation among the members of the Refining Syndicate that has controlled the works at Trebinje, Presburg, and Galicia, though prices indicate profits that should, we think, stand paring without causing a scare. Refined oil is now worth more than six times as much as the crude, and it was refined at a profit a few years back, when crude was double its present price and refined was selling considerably lower. Increasing the value of crude by one-sixth should not, therefore, materially affect refiners, while it will make a considerable difference to producers of crude who have insufficient storage to collect and save all that flows from the wells until prices mend. At the same time it is the supply from all these comparatively little sources of crude, as in Galicia, Java, and now in the islands of the Caspian Sea, that will tend to weaken the monopoly of the S.O. by contrasting the nature of genuine petroleum with the preparation that is sold as such in this country to-day.

### THE TABLES TURNED.

About two years ago, when the nitrate industry had been flourishing and was still thought to be promising, the Chilians were disposed to grumble at nitrate grounds being acquired by foreign companies, notably English, and if they could have had their way would no doubt have done something to hamper foreign enterprise, if not choke it.

There were others who, instead of losing time over words, set to work to procure *estacamentos*. Seemingly their action was untimely and ill-advised, for the English companies are not doing too well, and the Chilean purchasers rather less so. In consequence they have been petitioning the Chilean Government to lengthen the period in which payment has to be made for the grounds purchased. The native producers claim a loss of about 30 per cent. through the depreciation of the price of nitrate and currency changes, which, it is stated, foreign producers have not been subjected to. How English and other companies have secured immunity from similar losses there is nothing to show, the bare statement being all that is adduced. It needs very little inquiry to find out that English companies have suffered as much as native companies; and yet they have duly paid their instalments,

though in one or two cases companies have been hard put to, and dividends have shrunk to very small proportions.

In spite of these facts the report of the Commission recently laid before the House of Deputies is emphatically in favour of granting an extension of time to the distressed Chilians, and it is only a small minority report that gives voice to the injustice thus wrought against those who have already discharged a *quota* of their indebtedness.

We by no means grudge the Chilians the alleviation that is to be accorded them, but ignoring all the bearings on the past, we certainly hope that the same measure of mercy will be meted out to foreign debtors, should they, under stress of circumstances, make a similar application during the next twelve months.

#### BORIC ACID AS A PRESERVATIVE.

The gradual growth of boric acid as a preservative of food stuffs, appears to be causing considerable anxiety on the part of sanitarians, and the recent decision of the trustees of the Cork Butter Market to put about half a pound of "preservative" to every half cwt. of butter, has apparently given considerable offence. It is admittedly difficult to actually ascertain how much boric acid would pass into the system in a day if this preservative be used in all sorts of edibles, but we are disposed to think that the sum total cannot be very serious, if the quantity in butter may be taken as a criterion of the quantity that would be taken daily. Making the somewhat liberal allowance of 4 oz. of butter to each person per diem, the amount of boric acid consumed daily would be slightly over 17 grains. The official dose ranges from 5 to 30 grains. It is true that a continual consumption of even very minute quantities of an antiseptic may have deleterious effects upon the system and digestion, and apparently on this ground the use of boric acid in wines is forbidden in France, and has been declared injurious by the highest hygienic authorities. At the same time it is exaggerating, to say the least, to speak of butter containing rooth part of boric acid per pound as being drugged. It is daily used in milk, cream, wines, jellies, and in salting fish in this country, and so far little has been heard from the medical profession against its use. As far as the Irish trade is concerned a more potent argument is to be found in the fact that by cultivating a taste on the part of the public for butter absolutely free from preservatives, a serious blow will be struck at Australian and New Zealand competition, since without the use of preservatives it would be impossible for fresh butter to be sent from the Colonies into our markets. The difficulty here will lay, we fear, in persuading the public to forego even "dangerous butter," if it be cheap enough, in favour of genuine Irish produce.

#### THE INSTITUTE OF CHEMISTRY.

The annual general meeting, which is to take place on Monday next, at four o'clock p.m., in the rooms of the Institute, Bloomsbury-square, promises to be of considerable interest. The report of the Council shows that they have had many interesting subjects under discussion, one of which has been the difficulty that is experienced by qualified chemists and assayers abroad, through the issue of false assays by unqualified assayers. These assays are frequently rendered wofully misleading, and it certainly should be the aim of the institute to suppress, as far as lies in its power, the issue and spread of such reports. This, of course, can only be done by imbuing assayers with the importance of maintaining the honour and integrity of their profession, and by confining, as far as is advisable, the assaying practice to competent men.

It must be admitted that, to the unscrupulous, the notion of accidentally obtaining misleading results, especially when we take into consideration the benefits that are likely to attend the issue of an assay of a doubtful ore in these days of bubble co

Apparently, as the outcome of the discussion points, Mr. F. L. Teed will move on Monday immediate steps be taken to obtain compulsory registration of all practising analytical and chemists, and further, that membership of the compulsory to all intending practitioners in the view of the foregoing remarks, the first portion of certainly appears most desirable, though it is to that, in their endeavours to maintain the dignity of the profession, the council will not be led away in manner as the Germans have recently, in endeavouring to make it a criminal offence for chemists to conceal particulars of any secret process. If they do, we as was the case in Germany, that they will merely own ends, and stultify what might have been a noble move.

## Parliamentary Jottings

#### IMPORTATION OF MINERAL OILS.

IN the House of Commons last week, replying to (Leitrim, S.),

Sir M. W. Ridley said: My attention has been drawn to the importation of mineral oils. I am not aware in America with regard to the sale of these oils is that it is not allowed to sell to consumers in the United States with a flash-point under 95° or 100°F., while they can in countries oil at a flashing point of 73°F. and under; advised that the law as to flash-point varies in nearly every State that in some States there is no law at all. To prohibit the importation of petroleum with a flash-point of less than 95 or 100 degrees Fahrenheit is prohibitive of mineral spirit which is required in many in the question whether an amendment of the law in regard to the importation of mineral oils is desirable is one that will doubtless be carefully considered by the Select Committee which I hope will be appointed.

#### PARCEL POST RATES.

On Monday Mr. Hazell asked the Secretary to the Treasury whether he would open negotiations with the railway companies to reduce the parcel post rates for all kinds of parcels, as the Government did not consider it practicable to introduce specially low rates for agricultural produce only.

Mr. Hanbury said no alteration could be made except a reduction of the rates charged by the Department general Government was unable to consent to.

#### ADULTERATED BUTTER.

On Tuesday, Mr. W. Long, in answering Mr. Kearley's application of the word "butter" in relation to butter and margarine, either in the Customs entry or otherwise, or application of a false trade description within the meaning of the Merchandise Marks Act, and if upon the arrival and exportation of the goods the officer of Customs was satisfied that there was an infringement of the law in this respect it would be competent to detain them, with a view to proceedings being taken for forfeiture, if the circumstances justified it. The difficulty in the adoption of this course, however, lies in the fact that analysis of the butter has been made, it is impossible to detect adulterated, and goods of a perishable character could not be detained in the absence of special information as to the adulteration. The suggestion from the hon. member was that the consideration of the Select Committee which I have the honour to represent should be reappointed.

Mr. Kearley further asked whether any steps were taken by the Department to trace adulterated butter from the merchant to the retailer.

Mr. Long replied that it was the duty of the local authorities to trace adulterated butter from the merchant to the retailer, leaving it to them to deal with the retailers.

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

Artificial Manures.—D. Cross. 2,956. Feb. 10.  
Platinum Vessels for Concentrating Sulphuric Acid.—H. A. Kent. 2,957. Feb. 10.  
Painting Machine.—The Pneumatic Painting Machine Corporation, Ltd., and H. C. Cleaver. 3,033. Feb. 10.  
Reducing Nitrobenzol and Homologues with Hydrosulphide of Sodium.—J. Y. Johnson. 3,035. Feb. 10.

Steam Trap.—J. E. Slack. 3,472. Feb. 15.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal and ALL RIGHTS of publication are RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improved Method or Apparatus for Counteracting, Deflecting, and Distributing Gases and Flames in Chemical Works, Furnaces, or the like. F. E. Gätcke, 15, Marktstrasse, Altona-Bahrenfeld. Eng. Pat. 2,717. Feb. 7, 1895.

In glass works and many chemical industries the workers are troubled with the heat and fumes escaping when furnace doors are opened. The object of this invention is to prevent the escape of gases, etc., in this way, by means of an intercepting screen of air or steam. Taking, for instance, a glass furnace: Two pipes are run round the furnace, one above and the other below the "mouths" of the pots. The lower pipe is provided with a plurality of nozzles opposite each opening, and the nozzles on the upper pipe pass through the wall of the furnace at an angle so as to cause the injected air or steam to form an oblique shield or screen. In the same way the air passing upwards in front of the opening prevents the escape of the gases and the radiation of the heat, though the mouth of the pot is perfectly open and free for withdrawing the "metal." Where the fumes are objectionable, the screen can be formed of some counteracting gas. There are two drawings, showing the arrangement in detail and the general application to a glass furnace.

Improved Method of Rendering Acetylene and other Gases rich in Carbon, suitable for Lighting and Heating Purposes. L. M. Bollier, 12, Avenue d'Orleans, Paris. Eng. Pat. 6,101. Mar. 23, 1895.

Acetylene when burnt by itself emits a reddish smoky flame owing to the unconsumed carbon escaping. To make practical use of the gas as obtained commercially by Patent 2,820, 1895 (*C.T.*, 457, p. 131), the patentee has tried special burners, but these, apart from possessing certain inherent disadvantages, would entail too great a cost in the change of service. According to this invention, therefore, the desired increase of the surfaces of contact between the oxygen and the acetylene is obtained by diluting the latter with an inert gas. Air for this purpose is inadmissible owing to the explosive nature of mixtures of air and acetylene, and consequently ordinary nitrogen is employed. The proportions can be varied at will, but equal quantities of nitrogen and acetylene are found to give good results. The same principle is applied to other gases too rich in carbon to be burnt alone.

A New or Improved Method of Preventing the Putrefaction of Blood. F. V. Friderichsen, 68, Ny. Stormgalle, Copenhagen. Eng. Pat. 23,066. Dec. 2, 1895.

It is well-known that blood could be used to advantage in the preparation of cattle feeding stuffs if it could only be kept sound and free from putrefaction. This invention claims to attain this end by mixing from 10 to 70 per cent. of molasses or treacle with the blood, drying, and then using the resulting meal or powder, or using the mixture at once in the moist state.

A Process of and Means for Protecting Iron, Steel and like Materials from Rust. H. E. Newton, 6, Bream's-buildings, Chancery-lane, W.C. (Communicated by The Farbenfabriken vorm. F. Bayer and Co., Elberfeld.) Eng. Patent. 4,027. Feb. 25, 1895.

By this process the surface needs no previous preparation, but even in the rusty state can be coated with the mixture, which consists of hydroferrocyanic or hydroferricyanic acids, or a mixture of both, which form double salts, constituting a rust-preventing coating. This process is different from the old and well-known method of "blueing" with potassium ferrocyanide and ferric chloride, as this treatment did not ensure freedom from rust. The mixture is prepared by decomposing salts of the acids with any mineral acid, filtering off the precipitate, and adding to the same enough water to yield a mixture containing about 10% to 25% of the hydroferro- or hydroferric acid. The precipitates are not washed, as the  $\frac{1}{4}$ % to  $\frac{1}{2}$ % of acid which remains is found to be distinctly advantageous, and conducive to the action of the mixture. The precipitates can be mixed with wood spirit or any other desirable medium.

Improvements in the Preparation of Basic Slag for Fertilizing Purposes. W. Hutchinson, The Ferns, Pennfields, Wolverhampton, and A. Hickman, M.P., of Wightwick, Wolverhampton. Eng. Pat. 6,112. Mar. 25, 1895.

The efficiency of Thomas slag or basic slag is rendered greater by the addition of blast furnace or cupola slags. The latter being "acid" slags, rich in silicic acid and lime, renders the phosphoric acid in the Bessemer or basic Siemen's slag available and more easily assimilated. The proportions vary according to the strength of both slags, but as a rule equal proportions give satisfactory results. A analysis of an average blast furnace and cupola slag is given.

## EXPORTS OF SICILIAN SULPHUR.

THE following statistics have been compiled by Mr. A. S. Malcomson, of New York, and will be found useful as well as interesting:—

| To.                    | 1892.  | 1893.  | 1894.   | 1895.  |
|------------------------|--------|--------|---------|--------|
| United States .....    | 84,450 | 83,901 | 105,773 | 99,227 |
| France .....           | 73,176 | 89,736 | 56,932  | 69,696 |
| Italy .....            | 38,711 | 54,486 | 49,895  | 49,349 |
| United Kingdom.....    | 24,853 | 27,453 | 22,165  | 24,043 |
| Russia .....           | 14,178 | 19,730 | 17,977  | 17,962 |
| Portugal .....         | 13,490 | 14,545 | 8,670   | 14,562 |
| Germany .....          | 14,326 | 16,259 | 16,437  | 15,472 |
| Austria .....          | 9,096  | 10,169 | 11,494  | 12,170 |
| Greece, Turkey .....   | 14,845 | 13,840 | 16,870  | 16,195 |
| Belgium .....          | 5,133  | 4,358  | 5,644   | 6,410  |
| Sweden, Norway, D'mark | 4,501  | 6,579  | 7,887   | 5,730  |
| Spain .....            | 7,382  | 3,499  | 3,445   | 5,753  |
| Holland .....          | 2,183  | 2,957  | 2,365   | 3,335  |
| Other countries .....  | 3,152  | 1,680  | 3,376   | 7,732  |

Total, tons ..... 309,536 . 349,192 . 328,930 . 347,636

The stock in Sicily at the end of December, 1895, was 203,756 tons; 1894, 198,513 tons; 1893, 210,665 tons; 1892, 175,299 tons.

UNIQUE "SHERRY"—Adulteration seems hardly the word to describe the little trade trick reported to the Local Government Board as described in the new report of that Department just issued. A sample of British sherry, so-called, was in question, but the analyst could not say the sherry was adulterated since there was no sherry there. The only resemblance the mixture had to sherry was its colour. It did not even contain alcohol. It was "composed of sugar, a little essence, and bisulphide of soda." For the adulteration of food and drugs there is still a large field, thanks to the supineness of many of our borough and county authorities. The Local Government Board's report states that there are thirty-seven districts with an aggregate population of nearly two millions where the Sale of Food and Drugs Acts are entirely, or almost entirely, ignored. The appointment of an analyst is in itself a protection to a community. In the towns where samples are taken for inspection the number condemned as adulterated is diminishing year by year. Pepper, once a favourite article with the adulterator, may now be bought with more confidence. Out of sixteen hundred samples tested, only ten were condemned. Ten per cent of the coffee sampled is still found to be wrong, but the average for ten years after the passing of the Act of 1875 was 18 per cent, so that the taste in coffee or the honesty or the coffee dealer, or the fear of the inspector, must be different from what it was. A sample of tea condemned for containing an excessive quantity of mineral matter (including minute particles of glass), straw, woody fibre, and other things suggestive of shop sweepings, appears to have been unique.

## Official Memoranda.

(From the Board of Trade Journal.)

### CUSTOMS TARIFF OF NEW ZEALAND.

(Concluded from p. 68).

The following is an abstract including all materials relating to the chemical trades:—

|                                       |                                | Rate of Duty |

#### FREE LIST.

Rock Salt.

Acids: boracic, carbolic, in bulk; fluoric, muriatic, nitric, oxalic, oleic, pyrogallic, salicylic, sulphuric.

Disinfectants.

Drugs and Chemicals, viz.: alum; sulphate of aluminium; sulphate of ammonia; anhydrous ammonia; aniline dyes; arsenic; bluestone, or sulphate of copper; borax; catechu; chloride of calcium; nitrate of silver; cochineal; creosote, crude or commercial; glycerine, crude; gum, arabic and tragacanth; gum benzoïn; artificial gum arabic; gum damar; phosphorus; potash, caustic potash, and chloride of potash; pearlash; cyanide of potassium; sal-ammoniac; saltpetre; acetate of soda, crude; soda-ash; caustic soda; nitrate of soda; silicate of soda; sulphate of soda; sulphide of sodium; strychnine; sulphur; chloride of zinc; iron sulphates; gall-nuts; turmeric; saffron; nitrous-oxide gas; tree washes; insecticides; maltine, chlorodyne.

Sheep Dips.

Brewers' Water-hardening Chemicals.

Tanning Materials, crude.

Turpentine and Driers.

Dyestuffs and Dyeing Materials, crude.

Manures.

### THE ESPARTO-FIBRE INDUSTRY OF TUNIS.

Esparto-fibre, known as *halfa* by the Arabs and *alfa* in French, is a kind of marine bulrush which grows abundantly on the North African coast, chiefly in Tripoli and Tunis.

The principal districts in Tunis whence this product is obtained are the territories of the following tribes: Hemmema, Slass, Erghoumma, and in the neighbourhood of Cardato in Sfax and Susa.

Esparto-fibre is generally divided into two kinds:—The *rusia* long and straight, and the *mahbula*, which takes its name from the twisted nature of the growth.

The *rusia* kind includes nine different qualities, all taking their names from the districts in which they are found.

The Hemmema kind has a long and rather thick stalk, and is used for cigar straws and for the manufacture of artistic objects in basket-work, &c.; it is much employed in paper making, and is largely exported to England, where it is always in demand.

The Slass species is a very beautiful plant and preferred at Marseilles for the manufacture of *scourins* (mats which are placed under the presses in oil manufactories); it is used also in rope and paper making. The principal market in France is at St. Louis, on the Rhone, but though the consumption is on the increase, even there but little is asked for, paper being still largely made from wood and rags.

The Erghoumma kind all goes to England, being shipped at the port of Gabes; the Schebba kind is the most fine, very elastic, and is much used for textile purposes; and the other qualities are made up into paper, baskets, matting, carpets, etc.

The *mahbula* esparto is chiefly found along the coast from Mehdiä to Tripoli, about 25 miles inland.

At Sfax, in the months of June, July, and August, the inhabitants of the Kerkena Islands flock to the coast of the mainland, gather it, and make it into bundles, which are left to dry in the sun; in one day from 4,000 to 5,000 kilogs. can be obtained; it is spread on the seashore to be dried, then steeped in the sea, and again stretched out along the

sands to dry, after which the fibre is twisted and rubbed in the till a fairly good cord is produced.

The inhabitants of these Kerkena Islands occupy themselves addition with making other kinds of thicker rope, even cable these latter are much liked by sailors, being lighter than hen cheaper, and quite as durable. Sea-water, instead of detergent seems to strengthen them, and were it not for a certain elasticity they would be more generally adopted by larger vessels. Kerkenines also make baskets and mats for the backs of camels.

The export trade of *mahbula* by way of Marseilles is very small amount only being sent to Italy, but the thicker rope is sent to Trapani and Cagliari, where good use is made of it in the fisheries.

As an article for the textile industry esparto-fibre is principal in England, hardly at all in France, and very little in Italy.

The principal markets in Tunis for esparto are Sfax, Gab Skira, and the sale is effected by public auction, the municipal acting a land-tax; the stuff is done up in fresh bundles, which are well dried to avoid fermentation, and it is finally made up in portation in bales (by means of hand-presses) of about 150 each.

The Tunisian fibre pays an export duty of 1·27 francs per 100 but, if worked up, is exempt. The Tripoli fibre, on the other is not subject to any export duty at all.

### PRODUCTION OF SUGAR IN GERMANY.

According to the German official statistics as to the production taxation of sugar in the German Customs district, there were in 1894-95 467 sugar manufactories, 405 of which were by sugar factories, 56 were sugar refineries, and 6 were for extraction from molasses. These factories, according to the "Handels Museum" altogether 14,521,030 tons (metric tons of 2,204 lbs.) of beet produced 1,692,011 tons of raw sugar, as well as 992,136 tons of all kinds ready for consumption, the figures for the 1893-94 being 1,270,508 tons of raw sugar and 819,629 tons of sugar ready for consumption. The quantity of beet-roots worked up was the ever known in Germany; the 1893-94 figures were 10,644,355. The importation of sugar into Germany was insignificant, and remained about the same level as in the previous year. On the other considerably larger quantities of sugar were exported in 1894-95 the previous year, although the export of molasses has fallen to 1894-95, 609,663 tons of raw sugar and 392,857 tons of sugar ready for consumption, as compared with 436,674 tons and 262,6 respectively in 1893-94. The consumption of sugar in Germany year 1894-95 was computed at 552,695 tons of refined sugar, i.e. kilogs (23½ lbs.) per head of the population, which compares 10·1 kilogs. in 1893-94 and 9·1 kilogs., the average of the last working years.

## Legal Intelligence.

### SUPREME COURT OF JUDICATURE.

#### HOUSE OF LORDS.

(Before the Lord Chancellor, and Lords Herschell, Macnaghten, Morris, and Shand.)

REDDAWAY v. BANHAM.

This well-known case was re-opened last week, Mr. MacCall, argument on behalf of the respondent, maintaining that a person manufactured belting and in camel hair was entitled to call it "hair belting."—Lord Herschell observed that this was not a trade case; it was on a broader basis than that. The jury had found the respondents so described their belting that it was likely that it would be misled, and the law said a person should not be allowed to pass off his goods as those of another.—Mr. MacCall contended such a name as "camel hair belting" as applied to belting made of camel hair could not become the exclusive property of one manufacturer. Mr. MacCall, continuing, contended that the name camel belting was merely descriptive, but plus something else.—Lord Herschell said it was only part of the truth, and not the whole truth.—Macnaghten said he thought the learned judge's summing up extremely careful, and he put most clearly to the jury the question whether "camel hair" meant Reddaway's, and they said it. Lord Herschell said a man in the trade who said of the respondent material, "This is camel hair belting," would be telling a lie, but he would know that he was deceiving the purchaser. In conducting business the trade meaning of a word must be taken, and not dictionary meaning.—At the conclusion of the learned counsel's address, the Lord Chancellor said their lordships did not desire to give a reply. They would, however, take time to consider the form of judgment.

## Reports of Companies.

### BRUNNER, MOND AND CO., LTD.

Yearly ordinary general meeting of this company was held Liverpool last week. Sir J. T. Brunner, M.P., the chairman, presided. The report of the directors stated that the net showed a balance to the credit of profit and loss account of the half-year of £162,502., which, with the amount brought forward from the previous half-year, made a total of £222,502. The directors proposed to deal with the balance as dividend on the preference capital, at 7 per cent. per annum, dividend on the ordinary capital, at 30 per cent. per annum, amount to be written off patents' accounts, £2,500.; and to be carried forward, £95,678. The Chairman, in moving on of the report and balance-sheet, said they were of the factory character. There was a large new item in the net under the head of property and assets—that was the Middlesbrough. He mentioned at their last meeting in August had taken possession of these works on the first day of that month they had the results of five months' working in the net now submitted. He was very glad to say that there was effect that these Middlesbrough works would be a thoroughly item of their property, and that they would be a propounder in the making of a dividend. The items, stocks on hand owing to and by the company, were exactly in proportion to what was done. They were aware—in fact it was notorious—that they had during the last half-year entered into an agreement with Alkali Company and Messrs. Bowman, Thomson, and Co. shareholders would readily understand, the directors did such a movement, but they considered that in the interests of shareholders they were not bound to resist, and even that they had to accept, any proposals that might be made in this respect. The prices of alkali were, it was also notorious, below the market in most cases, and that, in the directors' opinion, a very unwholesome state of affairs. They were glad for the sake of bringing to an end this unreasonable competition. Indeed, as the directors of the Company always felt themselves, they were very decidedly of opinion that they ought not to put in such a position as would encourage fresh competition in the market. Therefore he thought all parties were agreed that they should raise the market prices so as to encourage undue competition. H. Coghill seconded the motion, which was agreed to. In reply, the Chairman stated that the agreement with the Alkali Company did not limit them in their make in any way. J. Galloway, Henry Brunner, Thomas H. Forgan, and Messrs. T. W. Read and Co., chartered accountants, appointed auditors.

### SALT UNION, LIMITED.

The annual report of the directors of this company states that the gross tonnage of salt delivered by the union in 1895 was 1,000,000 tons. The depression of 1894 in the large industries in which salt is used for manufacturing purposes was continued throughout 1895, whereby their demand for salt was considerably reduced. Coincident with the decrease in general shipbuilding from the salt ports of the country, there has been a decrease in the shipments of salt. The action commenced by Mr. Deakin, a vendor to the company, for breaches of agreement with him as a salt distributor came before the House of Lords in 1894. Their lordships decided one of the questions in favour of the company, but felt compelled to decide that in the other a breach of agreement had been committed. This was remitted to the committee for further consideration, and nominal damages of one guinea were awarded to Mr. Deakin. Against this decision Mr. Deakin entered notice of appeal in the courts. The matter being still *sub judice*, your directors are not able to deal with the merits of the case. During the year a sum of £14,697. 12s. 7d. has been spent on the development of your works in the Durham district, including the cost of loading stages and other shipping facilities. These extensions, despite the general decrease in the salt trade in the Durham district, enabled the union to increase its own trade there as compared with previous years. The Bill promoted by the union, in conjunction with Messrs. Brunner, Mond, and Co., Limited, for altering the name of the River Weaver Navigation Trust, came before a committee of the House of Commons in 1895. After hearing evidence the committee decided to incorporate the Bill promoted by the Weaver Navigation Trust with that of the union and the other traders on the river. The Bill, so amended, received the Royal Assent in 1895. Under this Act the union, which is the largest

toll-payer on the navigation, has now some representation on the trust. In conjunction with the District Council and other property owners and brine pumpers at Winsford and elsewhere, your directors opposed the Provisional Order Confirmation Bill of 1895, by which Northwich, Winsford, Middlewich, and Sandbach would have been joined in one area under one Compensation Board. After an inquiry lasting nine days, a Committee of the House of Commons amended the Confirmation Bill, and drew a separate district for Northwich. The Bill, as amended, will shortly come before a Committee of the House of Lords. Your directors have pleasure in stating that the issue in March, 1895, of £200,000. of "B" stock (part of the £250,000. authorised at the last general meeting) was duly subscribed and allotted. The premium received thereon, after deducting the expenses of issue, left a balance of £3,286. 18s. 11d., which has been applied in reduction of the sum paid for the acquisition of distribution businesses and of covenants with vendors. During the year the sum of £15,587. 13s. 4d. expended on new works, has been charged to the general capital account. The amount standing to the credit of profit and loss account for salt, brine, carriage, and sundry trading was £276,384. 14s. 11d., and from other sources £37,823. 18s. 11d., making the total amount £314,208. 13s. 10d.; after deducting the cost of maintenance of plant, distributors' discounts, agency, and other charges set forth in the profit and loss account, the profits from all sources amount to £162,154. 14s.; and the amount brought forward £10,158. 17s. 11d.—£172,313. 11s. 11d.; from this sum deduct the debenture stock interest paid on 1st July, 1895, and 1st January, 1896, £51,075.; leaving £121,238. 11s. 11d. Your directors recommend that dividends for the year ended 31st December last be declared at the rate of 7 per cent. on the preference shares, which will require £70,000.; and at the rate of 2 per cent. for the year on the ordinary shares, which will absorb £40,000.; and that there be carried forward £11,238. 11s. 11d. Also that the dividends be payable on and after 14th March, 1896. Mr. Herman John Falk and Mr. Walter Robinson, directors, retire by rotation, and offer themselves for re-election. The auditors, Messrs. Cooper Brothers and Co., London, and Messrs. Harwood, Banner, and Son, Liverpool, retire as usual, and offer themselves for re-election.

### THE PHOSPHO-GUANO CO.

The annual meeting of this company, whose works are at Seacombe, Cheshire, was held last week at the City Terminus Hotel, London. Mr. Thomas Chilton, who presided, moved the adoption of the report, and stated that their profits for the year amounted to £4,522. 11s., which, with £4,946. 16s. brought forward from the last account, placed £9,469. 8s. to the credit of profit and loss. He was sorry that their report was not so favourable as it had been in previous years. They had had a very poor year, and were only able to pay a dividend of 4 per cent. As all the shareholders remembered, they had a very bitter winter last year, and the weather, too, was exceedingly bad on the continent, and therefore it was impossible to use manure. On the continent last year there was a severe drought, which again reduced the amount of manure used. These were the principal causes which had led to the reduction of the profit and consequent reduction of the dividend. The competition of the local manufacturers on the continent had greatly increased, and so lower prices had to be taken. He believed that the state of the company would still remain strong, and it was better to give a dividend of 4 per cent. than reduce the amount carried forward. They had a large quantity of stock on hand, but it was not because they had purchased it, but because there had been no sale for it. He wished he had been able to give a better account of the company's working, and a better prospect for the future, but they could not look forward to improvement until trade revived. Mr. Robert P. Wood seconded the motion. In replying to a shareholder, the Chairman said that he could not hold out any fair prospect for the future, owing to local competition on the continent, which he feared would considerably reduce prices; but he assured the shareholders that the company was in a very sound condition. The report was adopted. Mr. R. P. Wood was re-elected a director.

### DIVIDENDS.

#### UNITED ALKALI COMPANY, LTD.

United Alkali Company declared dividend of 2s. per share on the ordinary shares (less tax), and 7s. per share on the preference (less tax), with £50,000. to reserve, against *nil* on ordinary and 7s. on preference, with £28,000. surplus.

#### THE SANITAS CO., LIMITED.

The directors of this company recommend a final dividend of 1s. and a bonus of 9d. per fully-paid share, making, with the interim dividend, a total distribution of 13¼ per cent. for the year ended December 31st.

## THE SALT TRADE IN 1895.

THE annual official returns of the salt trade just issued show that on the whole 1895 was a normal year. The total shipments of white salt came to 642,556 tons, and of rock salt 62,932 tons, making a total of 705,498 tons. The average for the ten years of white salt is 713,501 tons, and of rock salt 71,429 tons. In white salt there have been increases in ten markets amounting to 71,082 tons, against decreases in seven markets of 58,487 tons. The rock salt returns show an increase on white and rock salt on the year of 18,542 tons. The shipments to the United States, owing to the removal of the duty on salt, have been the largest since 1888, the total quantity sent to the Northern States being 64,064 tons, and to the Southern States 81,338 tons. The shipments to British North America have been slightly in excess of those of 1894, while those to the West Indies and Central America have been practically the same. The South American market has shown the largest relative increase of any, more than 50 per cent. of an increase on the shipments of 1894 having been made. There has been a slight improvement in the African market, notwithstanding that Germany is troubling the English manufacturers here, as in many other places. The East Indian market shows the largest absolute decrease of the year, amounting to no less than 47,368 tons, or over 80 per cent. of the total decrease. In the rock salt department Cheshire holds its own with great difficulty, owing to the unusually severe competition with Germany in the Continental markets, and Fleetwood and Carrickfergus at home. Fleetwood has shipped of white and rock salt in 1895 over 94,000 tons, as against 60,000 in 1894. The exports from Middlesbrough district have been less than in 1894, both coastwise and foreign.

## Paper-Makers' Column.

## ESPARTO IN 1895.

IN point of volume the trade in this commodity during the past year will compare favourably with its two immediate predecessors. There has been an increase of receipts, which may be regarded as a gratifying fact, while market values have undergone no violent fluctuations, and towards the close of the year a distinctly hardening tendency was apparent. It might be somewhat hazardous to conclude that prices during the last two years have touched the lowest possible level that can insure a supply at all, but evidence is not actually lacking in that direction. Algerian, perhaps, more than any other sort, has suffered from the "dry rot" in values, and that this has tended to curtail shipments is seen from the figures of the year. Tunisian also, although never very important as regards quantity nor general in consumption, has fallen to the lowest point since 1882. On the other hand, Spanish, which kept remarkably steady, and Tripoli, which underwent no permanent change of value, both show increased imports. The English consumption of esparto again marks a falling off, the total receipts being 76,721 tons, against 80,170 in 1894, but Scotland has considerably enlarged her use of the article by taking 109,687 tons, or nearly 59 per cent. of the entire import. It is in the latter country that the higher grades still find their chief support and readiest market. There, during the past year, 51,518 tons of Spanish, out of 60,629, and 46,142 tons Algerian, out of 61,979, were received and passed for consumption into the mills of the Scottish paper makers. Tripoli grass, on the contrary, has never made good its footing North of the Tweed, and continues to find its largest customers in the county of Durham. As compared with the previous year, esparto in the home counties has maintained its level. The Lancashire district exhibits a small increase, but the West of England has fallen to a comparatively insignificant total, and Cardiff, at one time a very important entrepôt, has almost disappeared from view. Chartering during the past year has had its periods of difficulty, and there have been occasional spasms of higher rates and dearth of steamers to disturb the minds and upset the calculations of shippers. The market at the beginning of the year was very bare of all distant enquiries, but bad weather at loading ports and on voyage retarding cargoes, temporary supplies were in request, and spot parcels changed hands to a limited extent. During February and March there was not much spirit in negotiations, and sellers were held back from offering freely by the disparity of prices in the home and foreign markets. Balers and shippers urged caution in making heavy future engagements, and recommended an advance of quotations despite the fact that other circumstances beside the available supply in producing countries controlled the value in the home markets. The opening of the second quarter of the year brought with it a somewhat improved enquiry, and this steadily expanded during May and June, and resulted in the closing of a number of important transactions for future delivery. Prices ruled fairly steady, notwithstanding that many consumers deferred making their usual contracts, and expressed an adverse inclination as to the maintenance of values. As the close of the half-year

approached the falling off of imports necessitated recourse to stock temporary supplies, and holders of stored parcels obtained full delivery of the higher grades, but African values generally were equally affected, and indeed receded slightly. In July activity placed the market to dulness and stagnation. The apprehensions excited by arrivals were allayed by fuller receipts, consumers' stocks were replenished, and with the dying down of demand for stored lot also the enquiry for distant shipments. A revival, however, took place in the succeeding month, and while sellers maintained their attitude of firmness, a slight advance was established in Spanish, and a stronger tone. Scant supplies in September brought about a renewal of uneasiness, both to sellers who had contracted engagements to buyers who were confronted with diminishing stocks. Full cargoes were paid for one or two early cargoes that were free for September and October, and, perhaps, with the exception of Spanish quotations for all positions gained strength and tone. The receipts of African in November more than sustained the improvement in values, and the business done in this and the last month of the year almost invariably ruled in sellers' favour. The invigoration of the market was aided by the generally improved tone in the trade of the country, and the great activity of production exhibited by paper manufacturers.

Quantity (corrected) of esparto and other vegetable fibre manufactured of paper imported into the United Kingdom during the following years:—

## NICKEL IN 1895.

THE chief use of this metal has continued to be as an alloy in the manufacture of steel, the demand in this direction having sustained the impetus given by the very successful tests of armour plate in nickel-steel in different countries.

The production of nickel in the United States from native ore practically ceased, and nearly or quite all the nickel refined or consumed in America is of Canadian origin. The other sources of supply are the French colony of New Caledonia and Norway, the production of Sweden, which at one time was of some importance, practically ceased. The amount imported into the United States from Canada in the form of matte (to be refined) shows a falling off from the figures being 3,138,400 pounds for 1895, against 4,897,191 pounds in 1894. With the Russian contracts already secured for armour plate manufactures in America and the certainty of increase in the consumption for the same purpose, the demand is sure to be greater, and the lower price makes the metal just so much more available as an alloy with steel. In spite of a rumoured agreement between the French company controlling the New Caledonia supply and the English in America to maintain the price and probably raise it, the low figure of 25 cents in large amounts will tend to extend its use, and recent improvements in refining cheapening very materially, the hitherto treated will tend to keep down the price.—*The American Manufacturer.*

CHEMICAL RECIPES.—We understand that the first edition of the book has been sold out, and that the Atlas Chemical Co., Sunderland, are preparing a second edition of 2,000 copies. This edition we hope, be free from the one or two blemishes we indicated in reviewing the first edition. Judging by the testimonials, the originals of which we have read, the second edition promises to sell as rapidly as the first, and intending purchasers should take steps to avoid disappointment.

INTERESTING DEFINITIONS.—A French paper contains the following interesting lines:—Tennyson could take a worthless sheet of paper and write a poem on it, and make it worth 220,000 francs—that's genius. Vanderbilt can write a few words on a sheet of paper and make it worth 20,000,000 francs—that's capital. The United States can take an ounce and a quarter of gold and stamp upon it an "eagle" and make it worth eighty francs—that's money. A mechanic can take a material worth twenty francs, and make it into watch springs worth 4,000 francs—that's skill. A merchant can take an article worth 75 cents and sell for four francs—that's business. A lad can purchase a seventy-five cent hat, but she prefers one that costs 10 francs—that's foolishness. A ditch-digger works ten hours a day and handles several tons of earth for four francs—that's labour.

## PETROLEUM ACCIDENTS.

THE following interesting correspondence has taken place between Mr. T. Graham Young and the "Lancet." The first letter, being Mr. Young's criticism of the Report of the Lancet Commission on Dangerous Lamps, ran as follows:—

Sir,—I read the report on "Dangerous Paraffin Lamps," which appeared in your issue of 4th January, 1896, and, whilst admiring the trouble and care you have taken to settle such an important public question, I cannot agree with some of your conclusions, and would point out that they are quite at variance with those contained in your report on "Paraffin Oil" which appeared in your issue of 29th March, 1862.

In this latter report you distinctly state, after careful investigation, that 130°F., taken by the old open test, is the lowest point which can be consistent with public safety. Your conclusions are well stated in your issue of 28th June, 1862, when discussing the Bill for the safe keeping of Petroleum which had just passed through committee, and which contained the following clause, "Petroleum for the purpose of this Act shall include any product thereof that gives off an inflammable vapour at a temperature of less than 100°F." They were as follows:—

"No doubt the Government had had the advice of scientific men in fixing upon this standard, and so far the responsibility does not rest upon the proposers of the Bill. Still we maintain that the temperature named in the Bill, namely, 100°F. is wholly insufficient to ensure the safety of the public, and that, if it be not raised, accidents will still constantly be occurring, arising from the use of so volatile and combustible a liquid. The degree of permanent ignition necessary to secure public safety should not be less than 130°F."

In your report, 4th January, 1896, you advocate a point fully 30°F. below 130°F., and argue that, given an oil of a low flash point, the greater the safety from lamp accidents. It runs as follows:—

"We do not think there is any cause for raising the flashing point of oil above its present limit, 100°F., open test. We have indeed obtained distinct evidence that there is an advantage in using oil that is to some extent volatile at this temperature." Later on in the same report, "In the 'Lancet' of March 29th, 1862, it is written that this report revealed the fact in the most convincing and positive manner that much oil then sold in the metropolis was in a dangerous condition to the public. This has since been altered by legislation by the simple remedy suggested by our Commission, viz., the fixing of a standard of inflammability." The fixing of a "standard of inflammability" did not affect the legal flash-point. It was merely a translation of the old open test into the close test, and erred, in the opinion of numbers of scientific men, in allowing oils of a lower flash-point than before to come into use.

If oil of a sufficiently low flash-point at which it would give off an inflammable vapour under ordinary conditions of use, were safer than one with a high flash, then the necessity of a legal flash-point is questionable.

The experiments, detailed in the January 4th report of lamps, seem to distinctly prove that a dangerous oil was used, because when the lamp was broken, the oil, you state, burned furiously, which could not be the case with oil having a flash-point which you advocated in 1862, viz., 130°F., as the point of ignition would be above any temperature which could be reached under any ordinary conditions.

In common with yourself, I wish to sift out the truth of this matter, and would thank you if you would either publish this letter, or give some explanation of the apparent inconsistency in your columns.—Yours truly,

T. GRAHAM YOUNG

In their issue of February 8th, the "Lancet" makes the following reply:—Mr. T. Graham Young writes that he cannot agree with certain of the conclusions contained in the "Lancet" Commission on Dangerous Lamps and asks for some explanation on the apparent inconsistency that in 1862 the "Lancet" Commission upheld 130°F. as the lowest point that should be taken as the flash-point of burning oils, whereas in the recent commission we ventured to express the opinion that there was no cause for raising the flash-point of oil above its present limit, 100°F. open test, which was the standard fixed by the Government in 1862. It should be observed that fifteen out of fifty-three samples examined by the 1862 Commission were below, and in some cases considerably below, the present limit. We expressed this opinion because the experience of a third of a century which has since elapsed has shown that explosions are the exception and not the rule. In other words, the great majority of accidents and disasters, if indeed, not all, have arisen from the lamps being upset. There is not the slightest doubt also that many of the cases reported as explosions were not so in point of fact. The sudden ignition of escaping oil, as with a tilted defective lamp, is certain to convey the impression of an explosion having taken place. This being the evidence of practical experience—and we refer Mr. Young to the official statistics—affords very little argument that the legalised flash-point is an unsafe limit, at any rate as regards ex-

plosions, especially bearing in mind the enormous number of lamps in use compared with the explosions of which we have had any evidence at all of ever having occurred. *We have no experience of the same kind of oil of higher flash-point.* (The italics are ours.—Ed. C.T.J.) We could quote more than one case, however, in which the employment of oils of a flash-point considerably above 100° led to loss of several lives by the overturning of the lamps and the ignition of escaping oil. Mr. Young expresses, further, the opinion that if oil of a sufficiently low flash-point to give off an inflammable vapour under ordinary conditions of use were safer than one with a high flash, then the necessity of a legal flash-point is questionable. We do not think so if we understand the phrase "ordinary condition of use" correctly. We should not like to pour benzene, for example, from one vessel to another in the neighbourhood of a flame, and the public should be protected from the same liabilities in the mere handling of inflammable oils. We very much doubt if the substitution of oil of higher flash-point and used in the same defective lamps as those experimented with would be less free from risk. Whatever may be conjectured, the fact remains that by far the majority of disasters are not due to explosions but to upsets, and the simple device of a wick-tube descending to within a quarter of an inch of the bottom of the reservoir would provide against the occurrence of either contingency. Hence we are brought to the conclusion that improvement in the design and structure of the lamp is now all that is wanted to minimise, if not to reduce altogether, the dangers of paraffin lamps. The handling of gunpowder is not entirely free from risk, but no one would think of firing it in a defective gun-barrel.

## Trade Notes.

**SOCIETY OF CHEMICAL INDUSTRY: London Section.**—The next meeting will be held on March 2nd, at Burlington House at 8 p.m., when a paper will be read by Messrs Cross and Bevan on "Artificial Silk."

**SOCIETY OF CHEMICAL INDUSTRY: Liverpool Section.**—The next meeting will be held on March 4th, at 7.30 p.m., when the following papers will be read:—1. "The Analysis of Chrome Ore and Ferro-Chromium," by Mr. E. H. Saniter. Mr. Saniter will give also a demonstration of his process. 2. "Sulphite Pulp Manufacture in Scandinavia," by Mr. J. Beveridge.

**SOCIETY OF CHEMICAL INDUSTRY: Nottingham Section.**—The fifth meeting of the session will be held at Room 23, University College, on Wednesday, 4th March, at 7.30 p.m. A paper by Mr. L. Archbutt, F.I.C., will describe an evaporation test for cylinder oils, and the following paper is down for discussion: "Some Properties of Ferric Phosphate," by Mr. R. M. Caven, B.Sc.

**NEW PETROLEUM SUPPLIES IN THE CASPIAN SEA.**—The island of Tscheleken, in the Caspian Sea, is found to contain petroleum springs yielding oil resembling the Pennsylvanian product, and very different from that of Baku. The crude oil produces nearly 29% of its volume of kerosene, which burns similarly to American oil, and the higher fractions are rich in vaseline.

**MESSRS W. NEILL AND SON.**—We are informed that the business of this firm will be carried on as before under the same name of "W. Neill and Son." The new partnership consists of Mr. John Swallow and Mr. Edwin Cecil Watkins, who undertake the payment of all accounts, and will receive the assets. Mr. Swallow has been connected with the business for the last three years, and is intimately acquainted with all its requirements. Mr. Watkins served his apprenticeship with Messrs. R. Daglish and Co., of St. Helens.

**INSPECTION OF OIL VESSELS IN THE THAMES.**—Representatives of the Scotch oil trade met privately in Glasgow on Monday, and discussed the proposed list of regulations by the Thames Conservancy Board as to the inspection of oil-laden vessels previous to their entering the London docks. The feeling of the meeting was against the proposed rules, but it was agreed that a committee of Scotch companies should confer with the Thames Conservancy Board on the matter.

**FATAL EXPLOSION.**—A serious explosion occurred last week at the laboratory of Messrs. T. H. Redwood and A. J. M. de Hailes, analytical chemists, 15, Red Lion-square, Holborn. A gentleman named Arthur French St. George had obtained permission to make use of the laboratory to carry out some experiments connected with a patent. He was engaged with a cylinder, the contents of which are unknown, when an explosion occurred, and St. George was killed instantaneously, his head being blown off. An assistant named Thomas Waterworth Glass was badly injured. At the inquest held on Monday, Mr. Alfred de Hailes gave evidence of a very guarded nature, as he did not wish to divulge any particulars that might affect the patent. As Col. Majendi and Dr. Dupré were making investigations which were not completed, the Coroner adjourned the inquiry.

**SALT UNION AND THE CHEMICAL TRADE.**—The chairman of the Salt Union, in addressing the shareholders on Thursday, referred to the competition of the Alkali Union. An offer, he said, had been made by the Salt Union to arrange terms, but without success, and in consequence the Board were seriously thinking of going into the Chemical Trade themselves, and thus carrying the war into the enemy's camp.

**"NIAGARA" PULVERIZER.**—As will be seen from our columns this week, under the heading of New Companies, a syndicate has been formed under the most powerful South African and Australian auspices, to take over the selling rights in the "Niagara" Crusher and Concentrator, which has been attracting so much attention in mining circles. Messrs. Easton, Anderson, and Goolden, Ltd., retain, of course, their exclusive right to manufacture these machines throughout the world, but all enquiries with regard to them should be sent to the "Niagara" Pulverizer, Ltd., 3, Whitehall-place, S.W.

**PERSONAL.**—Mr. L. Mond has been elected President of the Chemical Section of the British Association for next year. Dr. Ludwig Mond, F.R.S., is well known as a distinguished technical chemist. In 1863 he developed what is known as the "Mond process of sulphur recovery from alkali waste," and since that date has devoted himself to the introduction and development of the ammonia-soda process of alkali manufacture into England. He has recently endowed a research laboratory in connection with the Royal Institution, London, thereby completing the original plan of the founders of the institution. Amongst his other scientific contributions to chemistry may be mentioned an important research on volatile compounds of nickel and iron.

**REPORT OF THE CITY ANALYST.**—The annual report of Mr. Sedgwick Saunders, the public analyst for the city, has been submitted to the Commission of Sewers. Dr. Saunders remarks that the hope entertained by public analysts throughout the kingdom, that by this time the Legislature would have effected improvements in the working of the Acts relating to the adulteration of food and drugs, had not been realised. Some attempt had been made in this direction by a Select Committee of the House of Commons, who had taken voluminous but not exhaustive evidence upon the subject. It would be, he says, useless to reiterate the objections resulting from the present anomalous arrangements under which the chemical authorities at Somerset House are enabled to over-ride the decisions of the most eminent analysts upon data they have never formulated, not to dwell further upon the extraordinary and discordant decisions given by magistrates throughout the country, nearly always in favour of the dishonest trader, and more in accordance with the idiosyncrasy of the individual functionary than the requirements of science and common sense. During the year 266 analyses have been made in the city.

**THE PROSPECTS IN COD OIL.**—A good deal of excitement has arisen in the market for cod-liver oil within the last few days, with an important advance of prices. Since the closing week of January unfavourable reports of the fishing season on the Norwegian coast have been received, but until recently these were little regarded, because in former seasons similarly discouraging accounts have often proved to be exaggerated. In the present case, however, the bad reports are beginning to assume consistency and seriousness in the market, and a large business has been done in London this week at prices showing a considerable advance upon those current a month ago. Latest telegrams from Bergen state that the quantity of fish caught is barely one-fourth of the amount taken up to the same date of last year. The deficiency appears to be due partly to scarcity of fish and partly to stormy weather. It is reported, moreover, that the livers are small, and the proportionate yield of oil correspondingly deficient. It is added that prices in Bergen have run up very high—higher indeed than those quoted in London,—and that the stock of last year's oil remaining there has run down to a very low point. The production of Norwegian oil last year was only 12,680 barrels, against 18,500 barrels in 1894, and 26,813 barrels in 1893.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Tar products as a whole are steady, Benzols being the only article that shows signs of weakness. For 90's 1s. 11d. to 2s. is now quoted, and 50/90's remain at 1s. 8d. to 1s. 9d. Carbolic acids continue very firm at last week's quotations, and there is also no change in naphthas. Creosote and anthracene are steady. Pitch keeps firm at 35s., f.o.b., East Coast.

Sulphate of ammonia, though easy in price, is steadier. The demand has fallen flat again, but there are buyers at the figures given below. Anything held for more money, however, hangs fire. Beckton is quoted £8. 7s. 6d., London outside makes £8. 7s. 6d., Liverpool and Hull £8. 8s. 9d., Leith £8. 7s. 6d. to £8. 8s. 9d. Forward neglected. Continental advices depressing.

### LIVERPOOL MINERAL MARKET.

The market for minerals has this week been very firm. Many What arrivals there have been are against forward contracts have therefore gone direct into consumption, and have not stocks in any way. The available stocks are practically nil, demand on the other hand is increasing. Ground manganese firm, and meets with an exceptionally good demand at £7. £11., and £13. 10s. per ton. Sulphate of manganese is demand. Manganiferous iron ore: There have been many in for this at advanced prices. Chrome ore is steady. Bauxite demand is increasing, and prices are firm at 20s. per ton for 16s. per ton for second, and 12s. per ton for third quality, in cargoes. French chalk: There have been several arrivals week, but they have been all cleared, and prices are very steady 70s. to 75s., 80s. to 90s., and 100s. to 110s. per ton for "White" brands, according to grade. Wolfram and scheelite: of the higher grade ores are still very low, and there is a tendency to higher prices. Arsenic is very scarce at £20. 1 per ton. Fuller's earth: The demand continues steady at 1 prices—55s. for ground, 75s. for impalpable powder, and 50s. for "Emerald" and other brands. Rottenstone: The demand for qualities continues good at full figures—£8. 10s. to £14. 1 according to grade. Ochres and umbers: There is more inquiry good staining qualities, and business is being done at 60s. to 6 ton for J.C. ochre, and 40s. to 45s. per ton for good quality. Carbonate and sulphate of barytes meet with improved demand full prices. Plumbago: The demand for lubricating and for qualities continues very good at £6. to £10. per ton, according to grade: prime Ceylon is in steady demand at £15. to £20. 1 according to quality. Pumice stone is inquired for, ground being at £6. to £7. per ton, and superior Teneriffe lump at £7. 10s. 1 Bog ore is in fair demand at 22s. 6d. to 25s. per ton. Mag Raw lump and powdered are steady.

### MISCELLANEOUS CHEMICAL MARKET

In the alkali trade business continues moderately brisk in main products. Bleaching powder is in better request for export without change in price, at £7. 5s. hardwoods, f.o.b., and £ woods, f.o.r. makers' works. Caustic soda also continues demand, and prices are steady; subject to usual variations for markets, the spot quotations are:—F. ob., Liverpool, 77%, £9. 74%, £8. 10s.; 70%, £7. 10s.; 60%, £6. 10s. per ton, 10-ton 1 upwards. Ammonia alkali firm, at £3. 7s. 6d., f.o.r., makers' Soda crystals and bicarbonate unchanged. Leblanc ash nominally 1d. to 1½d., f.o.b. For chlorate of potash and soda no change in nominal quotations, but still odd parcels offering concession in makers' prices. Sulphate of copper is in active demand and price firm, at £17. 5s. to £17. 10s., f.o.b. Saltcake steady 25s. to 27s. 6d. for Lancashire and Cheshire. Sulphur quick £3. 12s. 6d. makers' works. Potash, caustic, and carbonate in good request, and prices are firm. Caustic potash, 90%, £2 c.i.f. Carbonate, 90/92%, £17. 10s., c.i.f. In white powdered there is still an extreme scarcity, and £20. has been paid to deliveries, forward sales for some months having been made at £ to £20. Arseniates are, of course, proportionately dearer. Of acetate of lime there are still sellers at £4. 12s. 6d. to £4. 15 grey. £7. 5s. to £7. 10s., c.i.f. Other acetates without change position or value. Carbolic crystals are much inquired for, consequence of the large business already done there is every prospect of a firm market for some time to come. For aniline oil and demand is quiet, but prices are firm. Yellow prussiate of potash at 7½d.; cyanides, 1s. 2½d. For chemicals generally the demand is quiet.

### REPORT ON MANURE MATERIAL.

For the time of year there is very little business passing, and consequently prices are barely maintained. The quotations for phosphates are unchanged. There is fair inquiry, but it does not lead to much business. There is nothing to report in River Plate but the absence of cargoes offering. The nominal value remains 2 per ton, delivered good United Kingdom or Continental. Crushed East Indian bones on spot may be had at £3. 18s. 9d. 1 ex store, and for shipment at 2s. 6d. per ton less. On spot 1 bone meal offers at £3. 15s. per ton, ex quay Liverpool, at same price would do for shipment. Nitrate of soda is firm positions, and a good business has been doing; the delivery February having been unprecedented, spot value of fine quality per cwt., and of ordinary quality 7s. 10½d. per cwt. Due to

ordinary quality, are worth 7s. 10½d. to 8s. per cwt., and for shipment 8s. up to 8s. 4½d. per cwt., according to position, has been paid. Home-prepared dried blood offers at 7s. 6d. per unit, f.o.b. at works.

### THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, firm: Scotch warrants closed at 47s. 2½d.; Middlesbrough, 38s. 3d. cash, and hematite, 48s. 9d. Copper, steady: Chili bars, G. O. B.'s and G. M. B.'s closed at £46. 3s. 9d. to £46. 8s. 9d. cash, and £46. 11s. 3d. to £46. 16s. 3d. three months. Tin, firm: Straits closed at £60. 15s. to £61. 5s. cash, and £61. 5s. to £61. 15s. three months. Australian, £61. 7s. 6d.; English ingots, £64. 10s. Lead, steady: Spanish, £11. 8s. 9d.; English, £11. 10s. to £11. 12s. 6d.; Silesian spelter, ordinary, £14. 16s. 3d. to £15. Nickel, 1s. 2½d. Antimony, £29. 15s. Quicksilver: first hands, £7. 2s. 6d.; second hands, £7. 2s. Copper shares, firmer: Cape, 2½ to 2½; Copiapo, 2½ to 2½; Libiola, 3 to 3¼; Mason and Barry, 2½ to 3½; Rio Tinto, 18½ to 18½; Tharsis, 5 to 5¼.

GLASGOW, WEDNESDAY.—Market easy, with small business. Scotch done at 47s. 4d. and 47s. 3d. cash, also at 47s. 6d. and 47s. 5d. one month; closing with buyers at 47s. 2½d. cash, sellers ask 47s. 3d. Cleveland closes at 38s. 3d. cash; sellers ask 38s. 4d. Cumberland hematite done at 48s. 11½d. and 48s. 10d. cash, also at 49s. 1½d. one month; closing with buyers at 48s. 9d. cash, sellers ask 48s. 9½d. Middlesbrough hematite done at 46s. 2½d. and 46s. 2d. cash; closing with buyers at 46s. 1½d. cash, sellers ask 46s. 2½d.

### LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is quiet and in small demand, sales being few. Lagos has been done at £19. 17s. 6d. ex quay for a small lot. Olive is firm, and there has been a bigger business doing, chiefly in Seville and Malaga, at full prices. There is no change in the price of linseed, which keeps steady at 20s. 6d. to 21s. per cwt. for Liverpool makes in export casks. Cottonseed continues steady, prices for Liverpool refined being well maintained at 17s. 3d. to 17s. 6d. per cwt. Castor oil is firm, and prices are rising: Good seconds Calcutta is now held on spot for 2½d., and first pressure French 2½d. to 2½d. per lb. Tallow is very quiet, but prices remain unaltered. Resin is not in very good demand, but so far holders remain firm at current prices. There is a marked steadiness in spirits of turpentine, for which there is a fairly good inquiry at 21s. 6d. per cwt. Petroleum is quiet and easier, with American at 6½d. to 7½d., and Russian refined 5¼d. per gallon.

COLOURS are steady, without alteration in prices. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 60s. to 65s.; M.C., 65s. to 67s. 6d. Umber: Turkish quiet; Devonshire, 50s. to 55s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Zaffres: No. 1, 3s. 6d.; No. 2, 2s. 6d. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

### WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

The market for general chemicals seems to have weakened slightly, and one or two of the lines are marked a fraction lower. There is a notable exception, however, in sulphate of copper, which still rises. Bichromates are steady at the old prices, as held jointly by the Scotch makers in combination. There is talk of an advance in these, and consumers in consequence are keeping themselves in larger stock. The feeling in sulphate of ammonia is again depressed, and the price is down, though not as yet to the very low point lately touched as a record. At the moment £8. 10s. is the highest procurable, and letters from the continent offer but very indifferent prospects ahead, unsold stocks there being unusually large. In the mineral oil and paraffin sections the only change is some little easing off in naphtha, owing to the season. Oils are all pretty firm; solid paraffins still suffer from underselling, but candles are the worst off, being most cut into by competition.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £3. 15s. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 10s., 70/72° £7. 10s., 60/62° £6. 10s., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £6. 5s. to £7. 5s. nett, Tyne; saltcake, 27s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of

soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4½d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); chlorate of potash, 4½d. less 5%, Liverpool; nitrate of soda, 7s. 10½d. to 8s. 1½d.; sulphate of ammonia, £8. 10s. prompt, f.o.b. Leith; sal ammoniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £17. 5s., less 5%, Liverpool; paraffin scale, hard, 17½d., and soft, 1½d. to 1½d. per lb.; paraffin wax, 120° semi-refined, 2½d. to 2½d.; paraffin spirit (naphtha), 7½d. per gallon; paraffin oil (burning) No. 1, 6½d., and crystal, 6¼d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubricating) 865° £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were 15,841 bags beet unrefined and 1,891 bags beet refined.

### TYNE CHEMICAL REPORT.

TUESDAY.

In chemicals there is practically no alteration in prices, and the business doing is largely of a hand-to-mouth nature. Bleaching powder is in a shade better inquiry. Sulphur scarce at £3. 17s. 6d. per ton. Soda crystals, £2. 2s. 6d. per ton, gross weight, locally. With the approach of the spring months the demand generally should improve.

Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett; caustic soda, 76/77°, £9. 5s. per ton, nett; do., 70°, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £3. 15s. per ton, nett; do., 52%, £3. 17s. 6d. per ton, nett; do., 56%, £4. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s., per ton, nett; do., 90/95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

SALT.—South Durham salt is steady at 9s. per ton, f.o.b. Tees.

COALS.—There is still depression in the trade here, and more particularly in steam coals. Household coals remain dull, the fine open weather lessening the consumption. Coke very steady, with a large local consumption. Prices to-day:—Best Northumbrian steam, 8s. to 8s. 6d. per ton; second qualities, 7s. to 7s. 6d. per ton; small steam, 3s. 6d. to 3s. 9d. per ton; bunker coals, unscreened, 6s. 3d. to 7s. per ton; gas coals, 7s. to 7s. 3d. per ton; household coals, 10s. to 10s. 6d. per ton; coke, firm, at 14s. 6d. to 15s. per ton.

### HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

OILS.—Markets all round easy and inactive. The imports up to date compared against the same time a year ago have been:—Linseed, 77,670 quarters, against 37,977 quarters; rapeseed, 8,046 quarters, against 18,965 quarters; cottonseed, 42,016 tons, against 51,722 tons; olive oil, 4,390 casks, against 1,518 casks; rape oil, 702 casks, against 2,019 casks; oilcakes, 3,698 tons, against 2,445 tons; bones, 1,593 tons, against 1,325 tons; turpentine, 6,167 barrels, against 2,980 barrels. Linseed oil rather easier, spot closing dull at 18s. 9d. naked; at this price there are sellers March-April, whilst May-August offers at 18s. 7½d. and September-December 18s. 6d.; boiled and refined from £1. to £2. per ton extra. Export for the week, 960 cwt. Refined cotton oil also makes: Spot, 15s. 1½d. naked, and March-April 15s. 3d. to 15s. 4½d.; May-August, 16s.; barrels £1. 10s. and casks £1. per ton extra. Export of refined has been 6,420 cwt. Olive oil, plentiful and low in value, from £29. upwards. Turpentine unchanged. Boiled siccativ oil, £13. per ton. Castor oil from 2½d. per lb. Herring oil, £14. Cod oil from £16. to £19. per ton. Neutral liquid soap, £14. per ton. Sperm oil, £23. Mineral oil continues at the higher rates. Locomotive grease, £12. per ton.

CAKES.—A firm tone all round. Linseed cakes: 95% pure, £6. 10s.; Russians, £5. 17s. 6d. Oil cakes, £5. 10s. Cotton cakes: Best makes, £3. 12s. 6d. to £3. 13s. 9d.; seconds, £3. 8s. 9d. Rape cakes: Black Sea, £2. 6s. 8d.; East India, £3. 7s. 6d. per ton.

PAINTS.—Prices are:—White lead, £16. 10s.; red lead, £14. 10s.; oxide of zinc unchanged; dry red oxide from £8. per ton; venetian red, £4.; yellow ochre, £4. upwards; vermilionette, 5d. per

lb. upwards; ultramarine, 3d. per lb. upwards; lime blue, 16s.; black, blue, red oxide, venetian red, green, and yellow ochre paints from £11. per ton; linseed oil putty from 8s. 6d. per cwt.; paint remover, 25s. per cwt.; ready-mixed paints, in lever tins, from £24. per ton; black varnish, £5. 10s. per ton, in barrels free; oak varnish from 5s. 6d. per gallon

## New Companies.

**Niagara Pulverizer, Ltd.**—CAPITAL, £30,000., in £1. shares. This company has been formed to enter into an agreement with Messrs. Easton, Anderson, and Goolden, and to manufacture and sell Coward's Patent Niagara Pulverizer. The subscribers to the memorandum of association are:—E. W. Tompson, 99, Cannon-street, E.C., Esq.; H. M. Peel, Swansea, iron merchant; N. R. Hill, 99, Cannon-street, E.C., merchant; H. K. Burgess, 3, Whitehall-place, S.W., solicitor; H. Smith, 3, Lombard-street, E.C., merchant; E. E. Sawyer, Hill House, Woking, engineer; H. E. Golding, 99, Cannon-street, E.C., solicitor.

**Bootle Tanning Company, L'd.**—CAPITAL, £30,000., in shares. This company has been formed to acquire the business of tanners, glue, and size manufacturers from the executors of the Johnstone. The subscribers to the memorandum of association are:—G. Randall, 32, Field-lane, Litherland, tanner; S. Cooke, 5, C. road, Burnley, oil merchant; H. Hughes, The Mount, Penketh, man; T. Wilson, Kimberley-street, Liverpool, clerk; F. Hugh Ivanhoe-street, Bootle, tanner; P. Hughes, 14, Mellor-street, worth, tanner; W. Hughes, Pine-terrace, Stockton Heath, clerk.

**Central Compressed Gas Works.**—CAPITAL, £6,000., shares. This company has been formed to acquire and carry business of compressed gas manufacturers, now carried on by Messrs. J. Fennessy and R. Chapman, as Leonard Chapman and Co. subscribers to the memorandum of association are:—R. J. Fe 50, Old Broad-street, E.C., secretary; W. L. Hunt, 3, Winchester street, E.C., secretary; L. Chapman, 14, Flodde S.E., engineer; C. W. James, 25, Avington-grove, Penge, C. T. Bullough, 3, Ballater-road, Brixton, engineer; A. Troll, 240 road, Islington, clerk; V. Collier, 66, Josephine-avenue, B bookkeeper.

## IMPORTS OF CHEMICAL PRODUCTS

## LATE ADVERTISEMENTS.

### TENDER.

THE URBAN DISTRICT COUNCIL OF PADIHAM.

GAS DEPARTMENT.

THE Gas Committee of the above Council are prepared to receive TENDERS for the purchase of the surplus TAR and AMMONIACAL LIQUOR to be produced at their Gas Works, for One Year, commencing April 1, 1896.

For particulars, apply to

District Council Offices, Padiham.  
February 26, 1896.

J. R. SMITH,  
Clerk to the Council.

**FOR SALE.**—Pump, all Gun Metal, 3-inch Plunger, hand or power.—ANDREW OHLSON, Copper and Iron Works, 85, New-road, Whitechapel, London, E.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*,—payable in advance,—including postage in any part of the world, are as follows:—

|                                |          |

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

|                                |                        |
|--------------------------------|------------------------|
| 20 Words and under .....       | 2s. 6d. per insertion. |
| Each additional 10 words ..... | 0s. 6d.                |

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz:—

|                                |                        |
|--------------------------------|------------------------|
| 30 Words and under .....       | 1s. 6d. per insertion. |
| Each additional 10 words ..... | 0s. 3d.                |

## CURRENT TOPICS.

CHLORATE OF POTASH AND ELECTRICITY.

A PROCESS seems to count for nothing in the United States unless it can be made out to "lick all creation." It appears that a plant is being put down at Niagara for the electrolytic production of chlorate of potash by the Blumenberg process, which is based upon the direct action of the electric current on chloride of potash solution. The works, it is expected, will be ready by July. Though we have no reason to doubt the ultimate success of the process, so far everything that is said must be in the future tense, and should, we think, be couched with due consideration for the contrasts that will probably be made when it is possible to speak of the achievements of this process in the past tense. Such a course does not lend itself to the "booming" of a process however, and consequently a paragraph has been set going around the technical and general press to the effect that already the very commencement of these new works has led to a heavy drop in the price of chlorate, on the part of the main producers, the United Alkali Company, Limited. The paragraph, however, goes one further, and adds, "but the new manufacturers will probably undersell them in all the markets of the world." All this is of course very interesting, and it is always well to remember, in these days of rapid development, that you will not be far from the truth if you act on the principle that nothing is impossible. The originator of this little boom, however, was a little too zealous, for his anxiety to demonstrate the revolution the new process would work was greatly in excess of his information. According to the figures given, which show a reduction of about 60 per cent., the selling price still stands nicely above the value that has been ruling for the last five or six months. On this showing no doubt the new producers will be able to undersell, and probably, we are inclined to think, be undersold again. Without this lapse the paragraph might have done the work it was set to, but the introduction of such figures was worse than a crime—it was a blunder—and branded the whole as unreliable.

The electrolytic production of chlorate is nothing very new, as it has been produced on the Continent for some time on a commercial scale, and, though the power of Niagara is a great advantage to an electrical process, we have reason to believe that, should it be necessary, the principal producers in this country are not wholly unprepared to develop a process that will not depend for its success upon the advantages of location and access to Niagara.

There is also another point, and that is the growth of the demand. New processes do not present very serious difficulties to existing makers when there is a prospect of the outlet extending, and with Japan alone, although the totals for the last two years do not show any material increase, they make

a very striking contrast with the figures for 1892. With the growth of this rapidly-rising country there is cause to anticipate an increased demand, nine-tenths of which is already met from this country.

#### THE TESTING OF COMPRESSED GAS CYLINDERS.

As was foreshadowed in our annual summary of the doings of last year, the Fenchurch-street gas cylinder explosion is likely to result in the formulation of special legislation affecting the manufacture and testing of gas cylinders.

The Departmental Committee appointed by Mr. Asquith have concluded their inquiries and completed their report, which embodies many important proposals.

In the first place it is suggested that all factories producing compressed or liquified gases shall in future be subject to periodical inspection by the officials of a suitable department of either the Home Office or the Board of Trade. It is proposed to invest the inspectors with power to examine the specifications to which the cylinders are made; to inspect the methods employed to ensure proper thickness and thorough annealing; to test gauges and other appliances; and to examine the records of tests and require such alterations as may be found necessary for the execution of adequate tests.

The advantage manufacturers are to gain for submitting to this semi-inquisitorial surveillance is that, if they comply with the requirements of the inspectors, their works will be certificated, and they will be authorised by the Government to test and mark cylinders. On the whole this is by no means a one-sided arrangement, though the trade may be disposed to take exception to the proposal to issue special certificates to firms that are willing to undertake testing only, provided they are in no way directly interested in the manufacture of the cylinders. We should also be surprised if an effort is not made, before these proposals become law, to insert a provisional clause relieving makers from all claims for damages in the event of an accident with a cylinder bearing the Government stamp. Whether they would carry the point is another matter.

Apart from and beyond all this, however, there is one proviso that we would have great stress laid upon. The inspection of these works must not be relegated to any of the "unemployed" who may chance to be available in some one or other of the Home Office or Board of Trade Departments. Save under very exceptional circumstances—honourable and most estimable of gentlemen though they be—the inspectors must not be retired Army or Navy men. They must be men as individually and exceptionally qualified for their important and delicate work as the inspectors under the Alkali, &c., Works Act. Indifferent inspection will sicken the inspected, and stultify this effort to protect the public by making the law and its executors a byword.

#### THE GEIPEL STEAM TRAP.

IT is often advantageous to use a number of small steam traps in lieu of one or two large ones, and small traps are particularly useful for use on marine engine, cylinder jackets, &c. The following description of this trap as made by the Shillingford Works Co., Limited, Wallingford, Berks, will show how applicable the trap is to the requirements of steam users, whether for power or drying, &c.

The trap is the patented invention of Mr. Geipel, and is constructed on the thermostatic principle in which the difference between the heat of the steam and the heat of the water actuates a valve to discharge the collected water.

This principle has long been recognised to be the best, but the difficulty with most traps of this class has been that the motion set up by the expansion and contraction has been so exceedingly small. In some cases also the want of arrangements for rapidly adapting the trap for steam at varying pressures has not been satisfactorily met, and has been the cause of failure. These two difficulties are overcome in the Geipel Trap, and experience of its working shows that the best results are achieved by it.

The inventor is fortunate in having secured an appreciative acknowledgment from Professor Kennedy, who has had one of the "Traps" working for some time. The Babcock and Wilcox Company, amongst many others, have shown their opinion merits by installing the trap in considerable quantities.

As regards the construction of the "Geipel" Trap, it will from Figs. 1 and 2 that the expansion parts are arranged as that of an isosceles triangle, by which device a considerable motion is imparted to the apex for very small changes in the length of the parts; moreover, there is a certain amount of elasticity in the parts which there is not in the case of the direct thrust generally adopted in expansion traps, and which has hitherto resulted in cutting the face. The sectional illustration, Fig. 2, shows the method adopted.

FIG. 1.

Mr. Geipel in putting his invention into practice. The lower pipe is connected to the steam pipe, the upper iron pipe forms the discharge. These two pipes form the two sides of the isosceles triangle above-mentioned, the valve seat D being at the apex. The spindle C butts against the lever. When cold the brass pipe contracts, the apex D is drawn down so that the valve is fully open and the water is discharged. As soon as steam enters the brass pipe it expands and raises the apex, when the valve is closed. The valve may be set to blow off at any pressure desired, adjustment A is provided. In addition to this, when it is desired to blow through, the valve may be opened by hand by merely pulling the lever. The valve may be readily examined by unscrewing B; this is a desideratum, as it is a common occurrence for the valve in all steam traps to become choked with sediment or to require adjustment otherwise.

The trap is very suitable for fixing on the bedplates of engines, which purpose existing traps are generally too bulky. When fixing the trap for use place the trap preferably two or four feet from the steam pipe. Connect the lower or brass pipe with the steam pipe or vessel to be drained by at least three feet of pipe, in which a valve or cock may be inserted. The top or iron pipe should be connected with the

FIG. 2.

or it may discharge into a tank at any height within the limits equivalent to the pressure of the steam. In the latter case a return valve is preferable on the outlet to prevent the water from being drawn back into the steam pipe when cold. When the trap discharges into a tank it is an advantage to have a three-way cock on the branch being arranged to deliver to the atmosphere in order that the working of the trap may be inspected.

When fixing to new steam pipes it is well to blow through the connection to the trap before the latter is fixed, in order to clear away dirt in the pipes.

To adjust the trap, screw down the nut A on the lever until steam blows through, then slack back until steam is shut off by the nut. The trap will then only discharge water.

If any steam should blow through, the valve should be examined which may be done by unscrewing the cover B. Examine the valve seat and clean it occasionally after first starting. The valve is reset by the working of the trap may be seen quickly by throwing cold water over it whilst steam is on.

LIVERPOOL SALT SHIPMENTS.—The clearances of salt from Liverpool to Calcutta between January 1 and February 29 amount to 22,542 tons, the clearances from other ports being 4,450 tons. The clearances from Liverpool to other East Indian ports total 16,000 tons. The probable shipments of salt during March amount to 16,000 tons.

## The Patent List.

List is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of T. Davis and Alfred R. Davis, who report professionally value of Chemical Patents.

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

us Cement. W. Wardle. 3,519. February 17.  
n of Manganese and Preparation of Compounds. J. H. Torres. February 18.  
and Purifying Water. W. Leach. 3,616. February 18.  
CO<sub>2</sub> from Lime Kilns. A. D. Delsemme. 3,652. February 18.  
R. McKenzie. 3,725. February 18.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Abstracts are specially prepared for the Chemical Trade Journal RIGHTS of publication are RESERVED. This is the earliest abstracts of Chemical and allied patents accessible to the

nd Apparatus for Extracting Colouring Matter from Dyewoods. Mafat, 17, Rue de Lions, St. Paul, Paris. Eng. Pat. 6,967. April 4,

Kohlrausch and other processes perfect extraction of the matters is impossible owing to the presence of air in the pores of wood. In this process a series of five vessels, in the shape of a trustum wider at the bottom than the top, is employed, being false bottoms on which the chips rest, and beneath which a funnel is situated. These vessels are exhausted by an air pump or so that the extraction is carried out under a vacuum, while the of the liquors is so arranged that the wood is boiled successively with juices of decreasing strength and finally with water. There is a drawing showing the arrangement of five vessels, and the steam, water, and juice pipes for the same.

Process of Making Oxide of Lead. H. H. Lake, 45, Southampton Row, London (communicated by T. Benfield, 324, Mount Prospect, Newark, Essex County, New Jersey, U.S.A.). Eng. Pat. 25,009. 1895.

Lead is treated so as to reduce it to a fine or granulated state, stirred and blown with a current of air in a tank of water, partially oxidizing the lead. The partially oxidized product in a tank is run off (the metallic lead settling out rapidly by reason of its gravity, or else a suitable separator is employed) and again in a second vessel to the action of an oxidizing gas. The product obtained is claimed to be superior to that produced by the ordinary process, owing to the complete absence of any metallic lead, and the absence of acids which cause crystallization. There is one drawing of the plant used. The tanks are round and fitted with a stirring mechanism consisting of several radial arms carrying hollow ploughs. The shaft of the shaft carrying the arms is hollow, and through it by branch pipes air or oxygen is conveyed to the hollow ploughs. The feature claimed is the joint action of the air and water on lead under the special conditions of agitation and comminution.

Process for Obtaining Caustic Soda, Hydrogen, and Chlorine by Electrolysis of Sea Water and in Treating the By-products thereof during such Process. G. B. Baldo, Via Standion, No. 15, Vienna, Austria. Eng. Pat. 27,106. Oct. 7, 1895.

Sea water is concentrated to 1.06 Sp. Gr., and then electrolysed in a cell, briefly described below. The chlorine and hydrogen are dealt with in the usual way, while the sodium that tends to be taken up by the negative electrode is taken up by water to form caustic soda. The residue in the cell still contains undecomposed salt and free acid. It is distilled, and the first three-fourths of the distillate is collected. The last quarter is collected, and consists of weak solution. The dry residue from the distillation, consisting of sodium sulphate and salt, is heated to a redness in iron vessels. The vapours are passed through barium chloride to remove all sulphuric acid, and the vapours of pure HCl gas passed through the weak solution previously obtained, producing pure hydrochloric acid of any desired strength.

There is one sectional drawing of the electrolyzing cell. A porous pot containing a carbon electrode is surrounded by a metal vessel acting as the negative electrode, the whole being enclosed in a water jacket. The concentrated sea water is placed in the porous pot, and pure water in the space between the porous pot and metallic electrode. Charging tubes and exits for the gases are provided, as well as draw-off cocks to remove the partially decomposed sea water and weak caustic soda solution.

### Improvements in the Electrolytic Manufacture of Alkali-Chlorate.

Wetter, 433, Strand, W.C. (communicated by The Elektrizitäts-Aktiengesellschaft vormals Schuckert and Co., Nürnberg, Bavaria). Eng. Pat. 7,364. April 10 1895.

The process is carried out without the use of diaphragms and at a high temperature. By preference a saturated solution of potassium chloride to which 2 or 3% of potassium bicarbonate has been added is electrolysed in an iron or earthenware vessel provided with carbon electrodes at a temperature of 40° to 100°C and a current density of 500- to 1,000 amperes per square metre. Carbon-dioxide is passed in simultaneously. The yield of chlorate is maximum at first, and diminishes as the contents of chlorate increase, so that the duration of the process is regulated accordingly. Owing to the very deleterious action of even a very small percentage of hypochloric acid (*sic*) the conditions of this process are so arranged that the small quantity of carbonate employed is sufficient to form chloric acid immediately, at the given current density and temperature.

### Improvements in the Manufacture of Washing Powders.

A. Warwick, 6, Watford Villas, Battersea; J. Smith, 146, Disraeli-road, Putney, and P. W. Nicolle, 46, Bridge-road West, Battersea. Eng. Pat. 2,471. Feb. 5, 1895.

Sodium benzoate, which is a powerful non-poisonous disinfectant, is used in the preparation of dry soaps, thereby giving the latter valuable antiseptic and germicidal properties. The powder is prepared in accordance with patent 1,088/94, with the addition of 0.25% to 1% by weight of the sodium benzoate. Other alkaline benzoates can be employed.

## MAKING PETROLEUM-TIGHT JOINTS.

THE following useful notes have been communicated by Mr. Hiram S. Maxim to the *Engineer* on the materials and methods for making tight joints in petroleum pipes and vessels:—"Many have supposed it to be quite impossible to make a petroleum joint that would not leak, especially with the light varieties, such as naphtha and gasoline, when subjected to both heat and pressure. However, as a matter of fact, it is no more difficult to make a petroleum-proof joint than a water-proof joint. In making up steam or water joints we naturally employ something which is insoluble in water. If an ordinary steam or gas-fitter is asked to make a petroleum-tight connection, he is sure to employ red lead and oil, and for a gasket or washer he is equally sure to use india-rubber, both oil and india-rubber being quite soluble in petroleum. In my experience I find that a joint which is screwed together dry is less apt to leak petroleum than a joint made up of the orthodox red lead and oil. To make a good petroleum joint with common iron pipes, a very good system is to heat both the male and female threads sufficiently to dissipate every trace of oil; then make the joint up with thick shellac varnish, which may be combined with ordinary dry vermilion or even Venetian red. A joint of this kind I have found to stand well. A very good joint can also be made with ordinary yellow bar soap rubbed into the threads of the pipe, the grease first being removed. Treacle, honey, glue, mucilage, or glycerine are quite petroleum proof. For a stuffing-box, ordinary wicking saturated with common yellow bar soap may be safely employed. Canvas saturated with shellac varnish makes a good washer, but soft metallic washers are better. A very good flexible diaphragm for a regulator may be made of closely-woven cotton fabric varnished on both sides with a compound of gelatine and glycerine. About equal parts by weight make a very tough and elastic compound. Wooden vessels, bags, &c., may also be made petroleum-tight by saturating or varnishing with this compound. As a rule, all substances which are soluble in water are quite insoluble in petroleum. For stuffing-boxes for standing both water and petroleum, castor oil may be employed, as this peculiar oil seems quite insoluble in either water or petroleum."

THE ARKLOW EXPLOSION.—The official report of Colonel A. Ford on the fatal explosion of gun-cotton at Messrs. G. Kynoch and Co.'s factory, Arklow, states that the circumstances afford at least good ground for suspicion that it was the outcome of deliberate malice.

## MERSEY AND IRWELL JOINT COMMITTEE.

THE usual monthly meeting of this committee was held last Monday, at 44, Mosley-street, Manchester, Mr. Alderman Thompson presiding. The report of the Chemical Sub-committee included the following recommendation:—"Your Sub-committee have considered the advisability of the re-appointment of Sir Henry Roscoe, and they recommend that, during the ensuing twelve months, he be appointed chemical adviser to the Joint Committee at an inclusive salary of £725, such salary to cover travelling and other expenses. The Sub-committee also recommend that a special grant of £101. 0s. 11d. be made to Sir Henry Roscoe for special services rendered by him."

Mr. T. W. Killick, in the absence of the chairman of the Sub-committee (Mr. John Brierley), moved the adoption of that part of the report of the Sub-committee quoted above. They had in the past, he said, paid Sir Henry Roscoe £700 per annum and travelling expenses. As the average of the latter had been considerably more than £25., the Sub-committee thought it would be an advantage to give the salary now proposed, to be inclusive of travelling expenses. The Sub-committee felt very strongly that it was advisable to retain the services of Sir Henry Roscoe. His name had greater weight than that of any other chemist they could employ, and the work he had done for the committee had given satisfaction. With regard to the special grant, he mentioned that the sum really represented certain expenses incurred by Sir Henry Roscoe during the last two years. In answer to a remark by a member of the committee, Mr. Killick further said that if Sir Henry Roscoe were called in by other authorities who were in conflict with the committee, those authorities consulted him knowing that he was the chemical adviser of the committee.

Mr. Hunter (Moss Side) seconded the motion.

Mr. Alderman C. Brierley (Bury) said he had no complaint to make with regard to Sir Henry Roscoe's services in the past, but he thought the time had arrived when the Committee ought to reconsider its position with regard to their appointment of a chemical specialist. He moved as an amendment that this matter be referred back to the Sub-committee, with the recommendation that they should consider the advisability of appointing a chemist who should devote the whole of his services to the Joint Committee.

Mr. Alderman Noton (Oldham) seconded the amendment. Sir Henry Roscoe's services, he said, could be got if they were wanted on any special occasion. With regard to travelling expenses, he contended that they should be allowed only from Manchester, and not from London.

Mr. Alderman Cheetham (Rochdale) supported the amendment.

Mr. Killick did not agree with Mr. Brierley as to the work of the chemist in the future. That work, he thought, would be greater than in the past. Their action, as far as they had gone, had chiefly been in respect of pollution perceptible to the eye and nostrils. When they might be coming on debatable ground, the Sub-committee did not think they should give up Sir Henry Roscoe.

The Chairman remarked that as the chairman of the Sub-committee was detained by public duties elsewhere, it would be rather hard, after he had carefully considered the matter, if they should pass a resolution over his head.

In the course of further discussion,

Mr. Alderman Clay (Manchester) said he understood that, instead of the work being done by Sir Henry Roscoe, it was done by a young man, whom the Committee provided with a room for the purpose. The unfortunate part of the position was that they were not practically their own masters. He thought the time had arrived when they ought to have their own chemist under their absolute control, and if they wanted to call in men eminent for their names and position they could always get them by paying properly for their services. He supported the amendment.

In answer to Mr. Alderman Hopkinson (Manchester) the Acting Clerk said the item of £101. for "special services" was for travelling expenses and board and lodgings, but if entered as such it would be surcharged. If entered as "special services" it would be allowed.

Mr. Alderman Hopkinson said this reminded him of a case where an item was objected to when entered as "cab hire," but was allowed when entered as "cabbage." (Laughter.)

In the voting the amendment was adopted by eight votes against six. It was agreed, further, that the matter should be dealt with by the General Purposes Committee.

The Committee proceeded to consider in detail reports relating to complaints against local authorities and others in respect to river pollution. It was reported by the Consulting Sub-committee in regard to Stalybridge Corporation, Dukinfield Urban District Council, and Denton Urban District Council that the orders of court against these authorities expired some time ago, and no application had yet been made for an extension of time. The chief inspector reported that in each case the progress made with the construction of the works was

very unsatisfactory, and it was recommended that the C instructed to take further proceedings against these authorities apply for penalties against them for non-compliance with the court.

The recommendation was adopted, Mr. Killick (chairman sub-committee) observing that while some improvement was not in the state of the Irwell, there was none in the state of the Mersey.

In connection with a complaint against the Kersal Bleaching Works, it appeared that it was a question whether the local authority the company should undertake the works. If the authority the company, it was stated, would; and the matter was adjourned.

Complaints had been made to the committee about a heavy deposit of mud at Pomona Docks, in consequence of the state of the Mersey, and Mr. Hunter, as representing the district, moved the chief inspector be instructed to report on the subject. This was seconded, and agreed to.

## Legal Intelligence.

HIGH COURT OF JUSTICE.  
CHANCERY DIVISION.

(Before Mr. Justice Stirling.)

THE ATTORNEY-GENERAL AND THE ERITH URBAN DISTRICT COUNCIL  
v. THE THAMES FISH GUANO AND OIL COMPANY.

This was a motion for an injunction to restrain the defendant carrying on a fish manure manufactory at Belvedere, near Erith, to cause a nuisance. It appeared that in 1882 the Erith Local Authority had granted a licence to a Mr. Johnston to carry on business in question, which consisted of making artificial manure from putrid fish and other refuse. In 1887 the business was acquired by the defendant company and carried on by them for some time. The company was under a contract with the Fishmongers' Company to remove condemned fish from Billingsgate Market, for which they received a salary. Subsequently, on the application of the General Assets Company, who were holders of debentures of the defendant company, a Mr. Dixon was appointed receiver and manager of the business, and he had since carried it on. It was alleged that the machinery had allowed to fall into a bad state of repair, and consequently noxious fumes and vapour escaped from the manufactory, and volumes as to cause a serious nuisance to the neighbourhood. The smell from the works was so bad as to make people ill, and pungent that it could be perceived at a distance of two miles. Nuisance was not denied, but the case for the receiver was that he had done the best he could in carrying on the business. He had entered into a contract with Mr. Johnston, who was now acting as his agent for the sale of the business to him subject to a condition avoiding the contract in the event of an injunction being granted against the company. He asked the Court, therefore, if an injunction was granted to suspend the operation of it so as to afford an opportunity of carrying out necessary repairs and alterations.

Mr. Justice Stirling said that he must grant an injunction. The existence of the nuisance was clear. It was caused by the defendant company. Dixon in his capacity of receiver for the debenture holders. The reason suggested why an injunction should not be granted was that the contract for the sale of the business to Mr. Johnston might be rescinded; but his Lordship could not permit the continuance of the nuisance merely for the sake of putting money into the pocket of the debenture-holders.

Ultimately Mr. Dixon undertook to use his best endeavours to carry on the business so as to cause as little nuisance as possible, and that undertaking—

His Lordship suspended the operation of the injunction until the next day in next sittings. He also stayed further proceedings against the defendant company and the General Assets Company.

## QUEEN'S BENCH DIVISION.

(Before the Lord Chief Justice and a Special Jury.)  
CHRISTIE v. FOX AND OTHERS.

## THE LEEDS WATER GAS CASE.

This was an action brought to recover £2,664. 9s., damages for a fraudulent conspiracy, whereby the plaintiff was induced to purchase shares in the British Water Gas Company, Limited, whereby the sum in question.

There appeared for the plaintiff Mr. Cock, Q.C., Mr. McCauley, and Mr. T. M. Whitehouse; Sir Edward Clark, Q.C., Mr. Q.C., Mr. H. F. Boyd, and Mr. Colefax appeared for the defendants; the Right Hon. H. H. Asquith, Q.C., and Mr. Asquith appeared for Bernal Bagshaw; Mr. Greene, Q.C., Mr. Morten, and Mr. Ernest Bowen Rowlands appeared for Messrs. Fox and Mr. E. H. Connot for Cottam, the other defendant.

ock opened the case. The inquiry, he said, would be one of the importance—to the plaintiff because he had lost some and to the defendants both on pecuniary grounds and in connection with the issues raised as to character. It was also important to the plaintiff as relating to the liability of those who conspired to "rig" the market in shares. The plaintiff was a man of means, of no occupation, and there were five defendants:—Samson Fox, who had been a partner and company promoter, and had been guilty of most misconduct in the attempt to obtain money from the public—an attempt which had been most lamentably successful; John Charles, a professional company promoter, who had taken refuge in the Bankruptcy; John Hyde, the elder, and John Hyde, the younger, formerly members of the Stock Exchange, from which they had been expelled; and Bernal Bagshawe, the nephew and right-hand man of Samson Fox. The British Water Gas Company, Limited, was formed, and was never intended to have, any genuine business; it was formed upon the market for the purpose of speculating in the shares of the British Water Gas Company, Limited, and for the purpose of entering the ends of the conspiracy in which these defendants, and all promoters, were concerned. The company proposed to manufacture water gas out of water, a process which was not only for certain limited purposes. Steps were taken early to bring forward the water gas question in the works of a Mr. Wilson, at Stafford, where the water gas generators had been manufactured, and various worthless patents were acquired. The prospectus was issued on March 10, 1888, containing misleading statements with regard to the Stafford works and as to the patents which had been obtained. It was also presented that the system had been in actual use and had been successful. As a fact, some experiments had been made at some Leeds, in which Fox was interested, and had proved an utter failure. The company was registered on April 1, 1889, and in March 1889, the company were communicating with brokers in various parts of the country, to whom they offered commission for the placing of shares, asking their customers to send applications. These applications were in a very curious form, asking them to apply for three times as many shares as they wanted, adding that they would undertake only to sell their shares till after the special day of settlement on the Stock Exchange. Nearly the whole of the shares were thus tied up, and the price began to fall. The plaintiff received a prospectus, and invested in shares later, but did not apply for shares. The British Water Gas Company for various districts, rights which had no existence at all. The shares of these subsidiary companies were valued at £600,000, and this, added to the "leakage" of shares to the shareholders of the British Water Gas Company, caused a fall in the price. It became necessary to keep the price up. There was a meeting on May 8 of those interested, at which Fox, Cottam, and others were present, and they agreed to purchase shares at a price under 19 or at 19 premium. Shares to be purchased in the name of Mr. Samson Fox. During the next month about 100,000 shares were so purchased. The special settlement was on May 15, when the price was falling. In November the company, from which the plaintiff had paid a dividend of 5 per cent, but on November 15 it had paid no further dividend, and it went into voluntary liquidation. The subsidiary companies had expired previously. Mr. Wade said that the experiments made with the water gas process had failed. Up to that time he had no experience whatever in the manufacture of water gas. For lighting purposes and for smelting purposes it was practically useless. Mr. Wade, formerly a member of the Institute of Mechanical Engineers, gave evidence as to selling his works at Stafford to Mr. Fox for £7,000, and some shares. He agreed to sell his works for £7,000, and some shares. He saw the list of firms set out in the prospectus. He saw the list of firms set out in the prospectus. Attention was called to that he knew that those firms were interested, and he spoke to Mr. Cottam on the subject. He told him that while the statements as to the firms were perfectly correct, the general public would jump at the conclusion that they were interested in the water gas. Mr. Cottam replied that he thought he had more experience in drawing prospectuses than he (witness) had, and would take the responsibility of having done so. His (witness's) was an entirely different one from Fox's system. Witness, however, said the manufacture of water gas had gone on in this country for years—more than half a century. He believed the system of

the British Water Gas Syndicate was one that could be used commercially for illuminating purposes. He meant that money could be made by it as compared with ordinary gas.

In answer to his lordship, witness said that he had seen it in Moravia in 1889, before the sale of the patent to Mr. Fox. It was used for smelting purposes in Moravia. Witness did not think that any work was done at the Stafford works. The syndicate bought works at Huddleston, near Glasgow. Those works were for the manufacture of water gas plant, and work was done there.—The hearing was adjourned.

On his lordship taking his seat on Wednesday morning, Mr. Cock said a settlement was arrived at that morning and judgment entered for the defendants, plaintiffs withdrawing all charges of fraud. It was also arranged that there should be no claim for costs, except in the case of Messrs. Hyde, who were allowed costs.

(Before Mr. Justice Wills and Mr. Justice Wright.)

DEAKIN v. SALT UNION, LIMITED.

Judgment in this case was delivered on Wednesday. It will be remembered this case came before the Court of Appeal from the decision of the referee awarding the plaintiff nominal damages only. Mr. Justice Wills said plaintiff's complaint was that there had been a breach by the defendants of an agreement of November, 1888, to supply salt at prices not exceeding those charged by the defendants to other people with whom the defendants were dealing. Defendants sold salt to the plaintiff for several years at various prices. On the 9th February, 1889, the defendants bought the Runcorn Soap and Alkali Company, Limited, and supplied, by agreement, salt during the period covered by the claim at a lower price than that supplied to the plaintiff. It had been decided in the courts that in supplying this salt to the Runcorn Company they committed a breach of the agreement to the plaintiff, but the plaintiff's claim for £50,000. could not be maintained. The money was not paid simply under a mistake of the Act, but by virtue of a contract made under a mistake by both the contract parties. The action in question was for damages. The referee was right in saying that damages incurred up to the 9th of February were only nominal. There had been a breach of the agreement with the plaintiff by supplying salt to the Runcorn Company at a lower price than that charged to him, and on that head his lordship decided that the plaintiff was entitled to substantial damages. The case would, therefore, have to go back to the referee to assess the damages, and plaintiff must have costs of the motion. Mr. Justice Wright, in effect, concurred, but differed as to the principle on which the damages were to be assessed. Mr. Justice Wills said that the difference would not prevent the matter going back.

GOLD PRODUCTION IN THE RAND.—As was to be expected, the Rand output of gold in January compared badly with the returns of previous months, the total of 148,178 oz. being the smallest since January, 1894, when 149,814 oz. were produced. Compared with December, there is a decrease of 30,250 oz., and with January, 1895, a deficiency of 29,285 oz.

PERSONAL.—We are informed that a movement is on foot to erect a statue of Sir William T. Lewis whose services to Wales have been many. The impress of his work is to be seen over a wide area. Docks, mines, steel works, yielding comfort to hundreds of thousands, are his memorials. The seaman, the miner, the steel worker, have been unceasingly benefited by him, and his services have not ended there. He has been assiduous in looking after the wounded in the battle of Trade and Commerce; in establishing a fund for the injured; and in Mining Schools and Colleges; and not least, in Hospital work his generous sympathies have been exhibited. Particulars of the movement can be had from the Hon. Sec., W. J. Jones, 62, Thomas St., Merthyr Tydfil. Thos. Tyrer, Esq. (President of the Society of Chemical Industry), has for the second time been elected to the chairmanship of the Chemical Section of the London Chamber of Commerce.

THE NATIVE GUANO COMPANY, LIMITED.—Exception has been taken by Mr. W. B. Kemstead, on behalf of the Sewage Transmutation Company, to certain remarks made by the chairman of the N.G. Co. He says:—In the course of his remarks the chairman makes three statements which are not correct, and which I wish to contradict. The statements referred to are:—(1) "We are a company for the manufacture of a manure out of sewage, and we are the only existing company, and the only company which has ever existed, that has been able to make a marketable manure." (2) "There is no process that anyone dares to attempt to carry on in the midst of a town except ours." (3) "Our only rival is lime." The Sewage Transmutation Company, which has been in existence since October, 1893, and has been in active operation since that time, makes a marketable manure out of sewage, without the use of lime, and carries on its operations in the middle of a town; and so the statements referred to are quite incorrect and altogether unjustifiable.

## Reports of Companies.

### THE SALT UNION, LTD.

AT the seventh general meeting of this company, held last week at Winchester House, E.C., the Chairman (Hon. L. Ashley), in moving the adoption of the report and accounts (which appeared in the *Journal* last week), said the difficulties they had had to contend with were the low prices for salt in India and the feebleness of the chemical trade. Of the salt ports in this country Liverpool was the only one showing an increase in 1895 compared with 1894. The directors thought that that increase for Liverpool was very satisfactory, because it compared favourably with the general decrease in shipping tonnage at Liverpool. The increase in the salt shipments at Liverpool had been 2.29 per cent.; while the decrease in shipping tonnage at Liverpool in 1895 compared with 1894 had been 3.1 per cent. In the Middlesbrough district, though there had been a great decrease in salt exports in 1895 compared with 1894, it was satisfactory to report that the shipments of salt made by the Union had increased. The trade with the United States, though much less in quantity than ten or twelve years ago, showed some improvement. The exports to Northern Europe, in spite of severe competition with German manufacturers, had been increased owing to the special attention which they had paid to this branch. It was their hope that this increased business, due, they thought, to the superior quality of their products, would be maintained. In Belgium they had also had a satisfactory increase during the year, but to British North America a somewhat smaller quantity had been sent. They hoped their business to South America would increase, as during the past few months they had made tentative arrangements for the promotion of the Union's interests in that region with a gentleman who was a representative of several well-known commercial interests. To Africa there was unfortunately a decrease in tonnage. Africa should naturally offer an expanding market, but the fiscal regulations in many parts of that continent prevented the expansion which might be looked for. To Australia, also, shipments showed a considerable decrease, but this was only considered to be temporary, and to be due to special influences. The freight market to the Continent had been disturbed from various causes, and it had been difficult to get ships to Australia that would carry so low-priced an article as salt. In this trade they had noticed that good years often succeeded bad years, and they hoped that this would prove the rule in this case. In the Indian trade the Union had still been feeling the effects of the great coal strike, which paralysed trade generally, and the salt trade in particular, and resulted in diminished shipments. It had led to a great increase in the price of salt in Calcutta in 1893, so that in 1893 and 1894 a larger quantity was shipped from England and all other salt producing countries. The result was that the market became overstocked, and in 1895 the prices were so low that shippers abstained from sending the usual quantity to Calcutta, but it was hoped that the diminution of stocks would cause an increased shipment of salt this year, and the ordinary laws of supply and demand would again bring about a fair and remunerative price. The Calcutta market had been further disorganised, both as regarded prices and quantity, by the new conditions introduced by the displacement of sailing ships by steamers. In view of pushing their trade in the far East, they had last year sent out a special commissioner with very high introductions to China and Japan, taking British Columbia *en route*. Various interesting communications had been received from this gentleman, and they hoped in the course of a few weeks to have the benefit of his personal advice. The inland trade had been well maintained as regarded sales for domestic purposes, and if the present mild weather continued there would certainly be a good agricultural demand for what was really the very best and cheapest fertiliser. The chief decrease in the home trade had been the supply of salt for manufacturing purposes, and particularly in chemical works. In all chemical works, as they knew, the chief idea was to obtain the greatest possible amount of produce from the least possible consumption of salt. This problem was always occupying the attention of the greatest men of science, and the Union's trade had suffered both from the discoveries of new processes and the increased use of brine in the chemical trade. It had been further aggravated by the policy adopted by the United Alkali Co., Ltd., of entering into strong competition with the Salt Union as dealers in salt. It was found that while the demand for salt for chemical purposes had gone down from 600,000 tons in 1890 to 275,000 in 1895, they also had the United Alkali Co., Ltd., entering into contracts, and taking orders in the open market. He had always been in favour of each Union sticking to its own business strictly, and with this object in view the Salt Union had always been ready to make contracts with the United Alkali Co., Ltd., at moderate rates. He regretted that this view was not that held by the United Alkali Co., Ltd., and it appeared to the directors of the Salt Union that they must simply, in self-defence, utilize all their resources. They could not

sit still while their markets were being taken from them, and be necessary to carry the war into the enemy's camp. worthy of consideration whether they should not utilize the salt for the manufacture of the higher priced chemicals, and would start in the chemical trade with the newest plant would be free from the burden of old and obsolete works, and thus be able to hold their own even in depressed times.

As regarded their law suit with Mr. Deakin, the directors were merely defending the Union's interests. The increase in the price paid for the acquisition of distributors' agencies was due to a number of these falling due during the year, but this item was generally decreasing. They had increased their investments, and had thought prudent to buy their own 4½ debenture stock. A rather large sum under the head of "Accounts to be received from abroad" reflected the establishment of the depot system in India. At present was the only presidency in the whole of India in which English had any foothold, and there had been recently a strong attempt by importers to capture the Bengal markets. Indian dealers had attempted to mix inferior salt with the English salt, and it was if this was allowed to go unchecked English salt would be ousted, and they thought that by establishing depôts, and thus presenting English salt to the consumers' doors, they would maintain their position on the market. In 1885 the Calcutta deliveries of English salt were 279,435 tons, and of other imported salt 78,644 tons. In 1895 English salt was 240,557 tons whilst other salts reached 149,500 tons, so that while the imports of English salt had barely been maintained, the imports of the salt of other countries had doubled in ten years. English salt not having gained in any way from increased production and facilities of transport. He hoped all their outstanding business with the various railway and canal companies would be settled at the conference which was now meeting. As to the future of the export salt trade, being a ballast trade, was dependent on the commercial and financial conditions of other countries in all parts of the world. A forecast was difficult, but without taking too rosy a view, he thought they could look at the future cheerfully. Things were worse this year than last, and since the end of last year both price and exchange had considerably improved, and the freight market in Australia should naturally resume its normal state. They had been utilising to the greatest extent their works nearest to Liverpool, and some of the heavy charges of the Weaver traffic, and the share might be assured that nothing on their part would be wanting in the year '96 better than '95.

The Hon. C. W. Mills seconded the report, and after a number of questions had been asked and answered, the report was adopted. Messrs. H. J. Falk and Walter Robinson were re-elected directors, and Messrs. Cooper Bros. and Co., of London, and Messrs. H. Banner and Son, of Liverpool, were re-appointed auditors.
